Hi Bob,

With the same lashup (antenna clipped to C3) I would first make sure you can get get a peak on 40 somewhere near the center of rotation of the preselector knob. This ensures that something hasn't gone wrong with C2 (part of C1) internally.

If that checks out, then resolder the end of C3 back where it was.

Next, clip lead your antenna across R1. You may have to solder pigtails to the circuit board to get the clips hooked up (I use clipped-off resistor leads).

Check the receiver and preselector. You should hear good signals and the preselector should have a fairly sharp peak. If it works then the problem is likely Q1 or Q2 or the circuits controlling them. If it doesn't work then the problem is T1 or C1.

Best of luck with the troubleshooting.

73.......Steve Smith WB6TNL

Steve, WB6TNL:

I followed your suggestion (i.e. unsoldered C3 at the end connected to T1...) and was then able to hear much better--almost as well as with my IC-756 Pro II, just not nearly as much gain. Therefore, as you indicated, the problem is likely one of the components or soldering surrounding T1. I've inspected the soldering again and can't see anything.

How would you suggest I proceed now?

Thanks again for your help.

use your low powered multimeter to check that the t1 is soldered in properly also check that the fets arent shorted or installed in correctly.
t1 is actually a combination antenna transformer and preselector.
in the old days t1 would have been called an antenna coil.

Arthur

This topic certainly has appeared before ....

Many of these rigs use similar IC based receivers, similar xtals, a VFO or DDS, and some means to generate a few watts output. In receiving and transmitting they function similarly. The difference is largely packaging and controls. If you want a spiffy, fairly small rig the KX1 is probably the class leader. If something a bit larger is ok, and you can live with a manual antenna tuner - the PFR-3 is more economical. I prefer the paddle from W5JH, by the way. For tuning CW signals, the PFR-3 tuning arrangement works fine. I would not want every rig I own to be tuned in this way, but for a portable rig it tunes fine across normal CW spectrum. The direct frequency entry via the paddle works well if you wish to QSY a bunch. I sensed this was a good value, as I remember an earlier DDS rig called the DSW-series that sold for 2/3rds this price for a single band - and this rig has 3 bands and a decent antenna tuner and digital readout.

As for your interest in various power amp schemes, it may be worth your time in reading and perhaps experimenting. Yes a few watts from a few plastic transistors is quite amazing, but it works well.

I have an older PFR 3. The board is marked "rev A 2/9/2008". Found some of the problems thanks to this group, and have a few more to clear. Is this revision a very early one? Seems to be a difference or two when compared to the 3A, and a few more when I compare it to the older manuals on here.
So far, the "dead receiver" is present, although I've been picking my way thru guided by other's experiences. Some mis-wound toroids, differing component values,and the most confusing, the wiring of the BLT/co-ax/balanced line section. I see two ways to do it, and mine came wired a third way. I'd like to se a concensus on the ways it could be done, and still work!
There is no "tune" available via the menu button. Did this come out later?
Back to the bench. Thanks all for the tips.

Mike,
Just recently the XYL and I took a 4.5 hour drive to Nebraska. I put a 20m hamstick on top of the car and worked several stations with my PFR-3. It was a lot of fun! I love this radio!

Installed a newly wound T-1 as per DL2BQD's picture. Mine mounted with the two right side wires on the left, and vice-versa. Made a new L-1 as well. Changed C59 to .1uf, per the newer diagram. I can hear stuff! Transmitter still working OK, 5W out and clean. On to the BLT toroid. Oof.

Took out the BLT toroid, the wires on one side were off one hole. Rewound the critter, and found the holes in my board aren't as logically arraged as the newer models of the radio. Seems like you could make it sloppy and work, or neaten it up and not work. Maybe that's why the original builder built it neat.
Still cannot find where the "tune" function is in the menu. Goes to speed, memory, and A-B mode. Any chance the early ones had no tune function?

Hi,

Are you using these instructions?

Tune Mode:
This mode is used if you have an automatic antenna tuner which needs to see a steady carrier for a few seconds to operate.
For manual tuners, it is easier and less stressful on the PA to simply send a string of dots as you fiddle with the tuner.
To enable tune mode, click and hold close the MENU switch until the letter ☐T☐ is annunciated by the side tone and release
the switch. When you then release the MENU switch, the display will blank and a character which resembles a lower case ☐t☐
will appear on the left most digit. The transmitter can now be keyed by closing and holding closed either the dot or dash paddle. When you wish to return the rig to normal operation, click any of the switches.

These are from the Rev. B.2 manual.

If you are and it still doesn't work then you probably need a microprocessor upgrade. Steve Weber supplies them free for exchange of the old one. Contact him directly.

Sounds like you're making good progress. Best of luck with the project.

Wow. I just zoomed on the lead photo on the PFR manufacturer's page. That's the board I have. From the Rev A/date, the odd T3 layout, to the staggered resistors near the PB switches, staggered caps above the CPU, and the missing R52 (22K) to the left of them. Maybe R52 has a different designator on mine, or maybe not there at all.

No dice. Maybe it has to do with mine not having an R52. Can't read the print under most of the resistors, but my board doesn't even have to holes or clads for one.

1775. Securing the toriods

Yahoo group: pfr3_group
Date: 2010-10-31 19:26:54 UTC
From: gary_steinhour
Topic: 1775 Message: 1775

While I was building a recently purchased PFR-3A, I noticed the toroids flop around a bit. This could be a problem if the rig is subject to frequent shocks and vibrations during field excursions, causing a wire to break.

During my years as a professional technician, I have observed various manufacturers securing their toroids to the circuit boards with a clear silicone adhesive.

After completing my PFR-3A and was satisfied that all is functioning well, I secured the toroids with clear silicone adhesive. While not trying to promote any specific brand or company, I used the DAP Household Adhesive Sealant available at most hardware stores. I mention this product since it does not appear to change any of the electrical characteristics of any components it comes in contact with. If you implement this idea, be sure to let the adhesive cure 24 hours before using the radio.

Hi All:

I secured mine during the soldering. I would place the toroid and solder one lead. Then I solder the remaining. I then go back and gently heat a lead and pull the wire. By going all around the toroid that way, gently heating and tightening, the coil quickly becomes firm to the PCB.

It doesn't take a lot of pressure and one has to be careful they don't pull too hard.

By the way, a great design and great rig.

73,

Carey

You guys answered a question/concern that I have had since repairing an intermittent solder connection on T1.

Next time that I open the case I think that I will secure the toroids with a drop of something.

So far I have not had any problems with, nor firmly attached the torroids. I'll deal with that if trouble appears and I have to pull the board for some reason.

Wonder if anyone else has had problems with the battery holders. These things are junk. I've already had two connection failures where the outer connector becomes intermittent with the inner. Any suggestions? Or better replacements?

I've used Carey's method many times.. if the toroids are wound in the proper direction... they fit nicely. Care to not pull too tight, is a
good concern, but hot glue makes tuning a bad deal, and I like to know that the circuit is at its best, not just ok.
So tin first, leave the leads long enough to reach through the board and have a "tug it lightly" handle of lead, then whle holding tension on the leads, solder the lead solid. Done deal.. no problem. No wiggle. Then the only concern becomes a soft touch to tune the coil.
Have a great day,

While I was building a recently purchased PFR-3A, I noticed the toroids flop around a bit. This could be a problem if the rig is subject to frequent shocks and vibrations during field excursions, causing a wire to break.

During my years as a professional technician, I have observed various manufacturers securing their toroids to the circuit boards with a clear silicone adhesive.

After completing my PFR-3A and was satisfied that all is functioning well, I secured the toroids with clear silicone adhesive. While not trying to promote any specific brand or company, I used the DAP Household Adhesive Sealant available at most hardware stores. I mention this product since it does not appear to change any of the electrical characteristics of any components it comes in contact with. If you implement this idea, be sure to let the adhesive cure 24 hours before using the radio.

OK I think I'm done. After re-doing the BLT toroid, I was able to peak signals with the tuner inline. Since my fixed antenna is a 100'+ doublet, fed with 450 ohm line, a 4:1 balun and a short run of coax, I had to compress the turns to get the tuner working on the low end of 40. The other bands didn't seem to suffer. Changing the two 330K's to 470K (on the first AF amp) didn't do a heck of a lot fot the audio. I think the bigger difference came from the 10uf cap on the 386.
First QSO was an EA5 on 40. Again, thanks for the info here.
Mike AD1OS (I vote for the hot melt glue gun to secure the toroids)

When I read about the hot glue the other day I tried it on my end fed tuner.
Measured 2.8uH and then I coated the whole core with hot glue.
When it dried it measured 2.4uH.
I do not have the best meter and it was on while the hot glue was drying.
Anyway what I do is try to keep any core off any surface so I use 1/4" foam under the core,a dab of Elmers glue and it holds snug enough for me

FWIW, here's the complete paragraph:

"Of the materials tested, both types of RTV stand out as having a negligible effect on inductor Q. Hot melt glue and paraffin have a small enough effect that they should be tolerable for many applications. Duco cement seriously degrades Q, even in a much thinner layer than the other coatings. The "sealing tape", tested out of curiosity, shows just how great a degradation can be caused by a poor coating.
None of the coatings made much of a change in apparent inductance. This implies that the reduction in Q is due primarily to dielectric loss rather than simple increase in capacitance due to the material's dielectric constant.
Note the difference in inductance and Q between the coated and then coating removed sealing tape inductors, which were wound on the same core. Apparently physical differences in the windings (perhaps such as tightness and conformance to the core, or uniformity of turn spacing) are a major contributor to differences between inductors. All the cores used in the test were ordered at the same time, so they may have come from the same batch and have relatively little variation. On the basis of just the comparison between the inductor coated with sealing tape and then the same core cleaned and rewound, it's entirely possible that most of the variation between inductors in this experiment is due to winding differences. The variation might be less if smaller wire with less stiffness is used."

Hi Tom,

T1 is easy - all you need are 45 passes thru the hole beginning at the "start winding" position. Count each time you pass the wire thru the hole, nothing more.

As you are counting, just make sure at pass nr 40 you leave extra "slack" in the winding (so you can snip it later). Keep winding in the same direction until you have 45 turns.

Then when you snip the wire, you have a 5 turn primary inside the 40 turn secondary.

I made several photos of the receiver torroids (at about the 2:30 mark in the video):

http://www.youtube.com/user/NG9D?feature=mhum#p/u/1/2aZYegVjMhI

Close-ups of transmitter/ATU torroids are in:

http://www.youtube.com/user/NG9D?feature=mhum#p/u/2/wJs2iYGd-VA

Have fun Tom - you are going to love this little rig!

Mike,

Just wanted to thank you for posting the problem with Hendricks dummy load. I've recently been banging my head against the wall with the same problem, high SWR on a dummy load. Ohm reading on my Fluke was 49.8, MJF reading SWR of 13:1. Couldn't figure out what was going on. Saw your post and went downstairs and clipped out the detector diode. Bang zoom I have a functional dummy load again.

If you hadn't shared what you'd found with the group, I'd still be in the dark.

Thx es 73,
Bob

Good show! I actually did the CQWW with 100W and a G5RV, hunting and pouncing to see if I could work 100 entities in a weekend: close but no cigar with "only" 87.

Towards the end, when there were no more New Ones to be found, I decided to run QRP with my little Hendricks PFR3 and the G5RV: in about 25 minutes I worked: UA0,JA,KH6,LU,OH and KL7. Makes me wonder what I could have done with the 36 hours I was on using QRP. maybe next time.

If I had worked the easy to snag Ceuta Isl or Canary Isl. Big Guns, (they counts as Africa) AND an Antarctic QSO, I would be eligible for QRP WAC! One thing was for sure: the QRP was the more fun.

From: darin31683
Topic: 1797 Message: 1797

Hi Everyone,

This is my first post in the group. I finished the first assembly group, hooked up the 9v battery, turned it on, and all I get are 3 red decimal points on the display. Has anyone seen this before? I tried searching, but I didn't see anything that appeared to be related to my problem.

I soldered one component at a time, checked every solder joint as I progressed, and I tested every component my multimeter supported.

Thanks!
Darin

Hi Darin,
The orientation of the display is somewhat confusing, and also check the driver for proper orientation. I found it very easy to
set them both in reversed. I'd suspect that, if all the solder looks very good. It is easy for me to lose track of which edge of the board is up... when putting the display in place. Keep in touch, there are many helpful folks here,

Subject: [pfr3_group] 1st Assembly Group Test

Hi Everyone,

This is my first post in the group. I finished the first assembly group, hooked up the 9v battery, turned it on, and all I get are 3 red decimal points on the display. Has anyone seen this before? I tried searching, but I didn't see anything that appeared to be related to my problem.

I soldered one component at a time, checked every solder joint as I progressed, and I tested every component my multimeter supported.

Thanks!
Darin

it wouldnt be very hard for the designer to modify the software so it would work with a rotary encoder

It mounts centered betweent the tuner and the dial, and vertically centered. Built with the height of the components above the board prime concern. Very careful measurement to place it where it will fit correctly is required, then PLEASE remove the radio pc from the front cover, to drill or punch the hole for the shaft. I like a punch better than a drill. Esthetics you know. But again, for me, very careful measurement to place it.
one trick might be to use a sponge cut to the approx shape and size, then place it into the selected location, put the top cover back into place, two or three placements make it obvious as to where and how, exactly.

OK?

1806. RE: "Dial" for PFR-3

Yahoo group: pfr3_group
Date: 2010-12-03 01:07:09 UTC
From: Dale Putnam
Topic: 1806 Message: 1806

JB asked, and with it being the time of year it is, let me answer this with generalities for now, if someone wants the exact wiring, and such, I can do that, but I will have to refer to the notes/schematics and such that I have in the shack.
First the hookup consists of five conductors plus a power lead, including a ground. The four control conductors go to the high side of each pushbutton. Power is taken from the switched side of the on/off switch, tack it carefully onto the lead of the switch. I used a computer 6 conductor ribbon cable, taking it to the bottom side of the board all together, leaving enough length of cable to wire it in, with the board out of the case, test, then place the board back into the case.
The cable goes around the board, on the push button side of the board. The last conductor of the cable needed is a good ground, that is easy to pick up the ground plane of the board near one of the push button switches.
Please let Miroslav know that you intend to use your encoder with the PFR3, when you order. With the encoder, the counter still works but the freq control can be done from the pushbuttons, up or down, or with the encoder clockwise or counter clockwise. The encoder also allows for a touch to announce the freq, that is not necessary, as the dial is always on, while you are using the radio.
The encoder makes it quite easy to qsy across the band, at almost any speed, however, "spinning the dial" as can be done with some of the analog vfos isn't quite possible, as the encoder must count. So, you can turn the dial quickly, but it is sometimes possible, to out run the counter, when that happens the radio doesn't move or change freq. it just sits there, waiting for the encoder to count away.
This is a very nice addition to the PFR-3, and can be done with little effort, and a fine rewarding result.

How does that look JB?

On my PFR3, it doesn't say rev-A on the PCB, it has no "tune" function, and the mounting layout for the BLT transformer is different than a 3A. Also some differences in the audio circuit.

Dale,

Does the encoder actually enable tuning the radio faster from end to end of the band? The speed of changing freq. is my only objection to the buttons. I often find it faster to just enter the freq. I want.

Hi Keith,
The encoder MIGHT be a tiny bit faster.. but you have already found the fastest way to qsy, that being the DFE method.
However, for me, what the encoder does do... is makes it easy for me to move between two freq without having to watch the dial...
I can turn the knob, approximately the same each time.. first one way then the other.. and emulate having two vfos. Much the same as
what would be done in dx piles... and this one makes it extremely easy to zero the last successful station, or at least get close.

1817. PFR3 and 3A source code

Yahoo group: pfr3_group
Date: 2010-12-06 03:02:24 UTC
From: Steven
Topic: 1817 Message: 1817

Okay, what the heck. I added the source code files for both the PFR-3 and 3A to the files section. There might be a couple of AVR programmers out there who can hack the code and make some improvements or ehancements, but I didn't leave you much to work with. There are only 200 bytes of free program memory left. But then, a lot can be done with 200 bytes.

I belive adding direct rotary tuning is not possible without extensive modification of the hardware due to the hardware design and the lack of spare I/O ports. Of course, saying that might encourage someone to prove I'm wrong...

now im going to have to buy a pfr3a for myself so that i can tinker with its firmware.
"im a pic chip guy but i can probably work with an avr too."
some intresting features can be added to the unit like maybe out of band coverage for special applications + other interesting features.
maybe with a very small amount of additional hardware the firmware can be modified to make adding a rotary encoder very simple.
its takes a big man to expose his source code to the world.

I don't what the big thing is about tuning with the buttons. My only complaint would be the speed of the scan. Using a rotary knob would only improve this great radio (PFR3A) if the speed of crossing the band increased considerably.

Maybe two speeds for scan could be implemented? Too fast = missed signals... too slow= can't get there fast enough.
Or DFE could work in the latter case.

Maybe two speeds for scan could be implemented? Too fast = missed signals... too slow= can't get there fast enough.
Or DFE could work in the latter case.

I don't what the big thing is about tuning with the buttons. My only complaint would be the speed of the scan. Using a rotary knob would only improve this great radio (PFR3A) if the speed of crossing the band increased considerably.

Okay, what the heck. I added the source code files for both the PFR-3 and 3A to the files section. There might be a couple of AVR programmers out there who can hack the code and make some improvements or ehancements, but I didn't leave you much to work with. There are only 200 bytes of free program memory left. But then, a lot can be done with 200 bytes.

I belive adding direct rotary tuning is not possible without extensive modification of the hardware due to the hardware design and the lack of spare I/O ports. Of course, saying that might encourage someone to prove I'm wrong...

sony made some short wave portable radios that worked that way
if you held the tuning button down long enough the slewing rate would ijncrease "short tap a step short hold down slow slew long hold down fast slew."

I agree with Keith - tho tuning up and down with buttons did take a little getting used to. After a short time you figure out that pulling the UP BUTTON down does not make the frequency go down ;-)

I don't usually make big frequency excursions but, if I do, I use the direct frequency entry mode. It is easy to forget that you can do this.

If you have an operable window, I have found the best antenna to be one made by B&W. It is a sloped vertical that clips onto the window frame or sill and sticks outside at about a 45 degree angle. Then a wire counterpoise matched to the band you are working is run along the floor of your shack. It works best on the higher frequency bands, 20 meters and up. I have never tried one on 30 meters. Just keep in mind that when operating QRP, the antenna is the most inportant item. My PFR3A is a real killer when usid with my home antennas (40 meter dipole at 45 feet and triband yagi at 45 feet). It's a much bigger challange when we are out in the field and just throwing some wire up into the trees.

at qrp power levels as with the pfr3 wide range balanced/ unbalanced tuner. i believe that many diffrenrt types of simple antennas can be made up that will work even better then the bw thing.
even lamp cord could be used to make up a balanced antenna on 40 m
personally id use some 300 ohm old fashioned tv twin lead.
little balluns and matching trtansformers + traps can be easily made up "currents arent very high voltages are small"

Hi,

Don't take this as me being facetious but the PFR will work as well as any other 5 Watt radio on an inside antenna. If an indoor antenna is all you can use you'll just need more patience, persistence and optimization. Depending on your particular indoor antenna configuration, its performance might be amazing. It will certainly be better than no antenna at all!

Best of luck with your PFR-3.

I had several B&W antennas. What they need to work better is to put 2 feet of rod under the coil and have the feed insulated from the mount. I also cut that mount in half and added 18 inches to keep it away from the buildings brick wall. I also bent the coil of the mount so that the antenna was straight up and vertical. Every morning I got up around 4 AM and used my old MFJ CW rig from a SLA battery and one morning I was right on the grey line and worked Australia and Egypt. Later I purchased the Budd vertical and mounted that on the B&W mount. Later I replaced the telescope whip with a 58 inch long stinger. Take your time and use one coil clip for each band and move it around for lowest SWR then fine tune by adjusting the counter poise wire. However I found that cutting a counter poise wire for each band is much better. If you can you should mount the antenna at the top of the window then tack the counter poise wire to the wall. By moving the counter poise wire up and down you will see the SWR change so when the meter reads ZERO,tack it there. A ham in NC. Was running 50 mils of RF from his beacon and he received a qsl card from New Zealand so don't give up. Bob. AF2Q

No one has more steel around them then I do and I have no problem at all working DX with 5 watts
I also worked Germany with a Microvert 13 inch high antenna sitting on the table and my rig was an SST putting out about 2.5 watts.
My walls are loaded with steel beams and I worked into Europe with 30 watts with that 4 foot square rOCK LOOP antenna.
If you read your books you'll find the RF can get coupled into the steel of the walls and actually help the antenna
Hams all over the world are using indoor antenna.
Don't discouraging experimenting.

In a message dated 12/10/2010 7:50:35 AM Central Standard Time, hzp_electronics@... writes:

Keith,
My experience is that "any" outdoor antenna is better than an indoor one. The tuner with an end-fed wire about 65 feet long works well with about a 10 foot counterpoise on the tune. I use this configuration for portable operation and it works well.

Also if your building has a lot of metal siding or is stucco (with chicken wire), forget the indoor antenna!!
Good luck!! 73

From: Dale Putnam
Topic: 1825 Message: 1835

The particular situation that an indoor antenna lives/operates in, is pretty much the same considerations as those antennas that live outside. The same applies: matched, transfer all the rf from the tx into the antenna for radiation, via the lowest loss feedline possible. Now, how to make the antenna radiate... that would be part of the experimentation, however, you aren't really doing anything different than you would outside... you still need to find the resonant length, if it is a dipole, for example.. the length may be a whole lot different than expected, sometimes you can actually account for the differences, by taking in the effects of power wiring, if the air ducts are close, the roof gutters, the roof cap, the shingles, and for those that have the southwestern look, the wire that holds the tile in place, all of everything around the antenna will have some affect, and thus the cumulative nature of things will make the antennna look a lot different than one outside, hanging from the "free space" supports.
Or.. do the mental exercise of installing a "free space" dipole antenna. we know that it will be 492/f for the length, cut in the middle, feed with a balanced line, 72 ohm works well, and we have an antenna, put it up high enough. Since this is a mental exercise, put it up .... lets say 250 foot up. Alright then, now we have a good working antenna right? ok.. now we likely aren't going to have an attic 250 foot up, so lets pull the antenna down to say... 20foot. ok.. now we have a good working antenna.. it may not be a world class, contest smashing, top of the dx pile, first to get DXCC, best of the best antenna, but it will work for most all of what we need, for now. So, off to talk to the world now, right? Not quite so fast Kemo Sabe, first, let's put this antenna at 20 foot, in "free space", in some.... "protection" from the weather... so lets build some shelter over it.. and because it needs to stay warm lets add some heat, some power lines.. some roofing materials... ok.. now how does the antenna tune up? Did you need to play with the length.. a LOT? Yes, amazingly so.. but now it still works, just like it did, because the coupling into other things, only steals the energy in that particular direction... and I'm thinking that there isn't anyone with an antenna in that direction from your antenna anyway.
Sum it up? Sure, put your antenna in the attic, loop it around the room on pins, tack it to the ceiling with thumbtacks, lean it out of the window, connect your radio to the mobile antenna on your vehicle, (just disconnect before leaving, or the results will make you upset for more than a few days), but hook up your radio... put up an antenna, and get on the air..
Improve, change, move, adjust, and overall, make the antenna better.. as you spend time on the air.. yes! But the key? GET on the air... it won't get done, by lookin at it, nor worrying about what ifs...
Does it work like we want it too? Maybe, maybe not.. but it is working.. or not.. and when that is determined.. maybe the goal was to get on and have fun.. and instead you had fun... by building something (an antenna) and now it is yours. Is it perfect? Not likely, but it is yours, and now you can change it.
Good Luck, and Merry Christmas,

--... ...-- Dale - WC7S in Wy

i wouldnt expect great results with any type of in door transmitting antenna especially with 5 watts
on hf even though its cw.
something like the bw multiband whip antenna might work i would build up a very light duty low power version of it.
at 5 watts the counterpoise could be inside?? "i think im right"

I'm still at the stage of thinking of buying a pfr3 and I'm wondering how well this rig would perform with an apartment antenna?

Don't forget the hamstick dipole. Such an antenna can work well, if you get it up high. I've had good luck with this arrangement., though my qrp activity has been low.

Steve, Great comment.

"Jwonch20", A one-watt transmitter and 20m attic dipole is what recharged my interest in ham radio a few years ago. But QSO's of that kind are not very frequent and (sunspot nr. is 33 today) a low power transmitter with a smaller antenna might be very disappointing if that would be your only station.

The smallest antenna I have used with the PFR3 so far is 34 feet of insulated wire. Here is an example the antenna in use:
http://www.youtube.com/user/NG9D?feature=mhum#p/u/3/3kWvXJ_5XgE

But you could string it up in whatever fashion possible (high, straight, clear of other objects as possible). For example, here is the same 34 foot wire, this time held up by a bush about 12 ft off the ground in a horizontal position. (Power in this example is 10W.) You can see the relatively small, and low antenna worked fine:
http://www.youtube.com/user/NG9D?feature=mhum#p/u/43/JD-DjQuL7bk

If you could put up a temporary mast, to be removed after use then you could improve the efficiency. Here is a doublet with homemade balanced line feed. The support is a lightweight PVC tube and the wires are also light-weight. A better antenna makes 5W contacts more reliable:
http://www.youtube.com/user/NG9D?feature=mhum#p/u/19/qaUN9m2u1pQ

This may exceed the bounds of what an "apartment antenna" consists of (even if temporary), but other supports and less visible materials are options to consider. Food for thought... ! I think that the PFR-3A would be a great rig for you to take outside and use as a portable. Then there are virtually no limits to the types of antennas you can try with it useful built-in wide-range tuner. The PFR-3A is a great portable radio.

It would be helpful to know what radio and antenna have you used in the past. And, as I think might have already been asked, what kind of space do you have available? Any access to the attic for example? Or access outside of a window? Can you put up a temporary portable support for a few hours of use? Knowing a bit more about your situation would probably allow the pfr3_group to provide all kinds of useful ideas for your consideration, and may even be able to help answer the question you asked.

Hi,

Don't take this as me being facetious but the PFR will work as well as any other 5 Watt radio on an inside antenna. If an indoor antenna is all you can use you'll just need more patience, persistence and optimization. Depending on your particular indoor antenna configuration, its performance might be amazing. It will certainly be better than no antenna at all!

Best of luck with your PFR-3.

Hi Lynn and thanks for the photos
OK,
I'm not getting smart A## but I keep reading about what short anterrans can not do
Early this morning AH6V in hawaii worked a 2 way QSO with K9KHJ
this what the K9 ham says

I might have the world's most unimpressive shack---an HB1-A, battery, and a collection of straight keys adorn the top of a $10 desk wedged in between workout gear in our basement. My antenna is a Par Electronics end-fed sloper. All CW, all QRP.

I found that at times just listen and you wil hear some weak CW in the mud.
Even if you work some DX and then find out he has some big tower and a giant beam.
His station is doing the work.
You hear his 700 watts but his big 40 meter bean will hear your 5 watts from the small B&W antenna.
Check out www,qrpspots.com/
2 more stations just logged on.
Just load into what ever you can and go:-)

Lynn,
When I saw that 35 foot wire in the picture it jogged my memory.
A few months back I way playing with different size wires and I had one I measured to be 35 feet.
I dropped my small key so all I was able to do was put out a carrier and use it like a straight key.
Anyway I found that on 15 meters I never needed a tuner.
The wire went right to the rigs antenna port and the SWR was about 2 tick marks over the zero mark.
Something to try with different bands and a longer wire

Greetings,
I live in a high-rise steel structure apartment building in New York City. I don't have a terrace/balcony and I don't have access to the roof. I've tried stringing wire throughout my apartment and have had [to put it mildly] limited success. What's worked for me is a 40 meter Hamstick dipole, clamped to a broomstick and stuck out my bedroom window. The Hamstick is parallel to the building and only about 30 inches away from the brick-covered steel facade. I do this at night to reduce the chances my neighbors will notice. Over the past 7 years I've used different rigs running 1 to 50 watts, almost always cw. Operating [very] casually, I've managed to work 49 states and about 40 countries.

Dick,
Try several different antennas.
Try a mag loop.
I have to leave now but tonight I will post a picture of a 12 foot long 300 ohm wire that hs a small cap and coil at the base.
I works excellent on 40 and actually made for 40 meters.
Make it from that cheap RS 3000 ohm twin lead and just let it hang out the window.
I'm known as the ham in the can but still do very well.

My loop is only 3 feet in diameter and I have worked some super DX with Sudan being my best with 30 watts and again with 5 watts
I'm on the 4th floor with 6 inches if concrete above and below me,no craw space,steel window frames,screens in the windows and I still work DX with QRP
Don't hesitate to ask questions.

I am using the Palm but haven't mounted it. I just hold it in my hand. But I would use double sided tape and put it on the right side of the PFR3 cabinet protruding just enough for the paddles to stick out. Thought about magnets but did not know if the magnetism would affect anything.

As to paddles, I use the paddle kit offered along with the PFR3A. After a somewhat challenging assembly it just plugs in and attaches to the front of the PFR3A. It operates flawlessly at 25-35 wpm. One thumb screw removes it if you want to use another paddle. It's mechanical, not capacitive, and, therefore very easy to get used to. Originally I thought that I would only use that little paddle when in then field. I found that it works so well that I never remove it from the radio.

Check these out. They bolt right up to the front panel. Very nice. Scroll down to the PFR-3 paddles...

Subject: Re: [pfr3_group] indoor antennas

I had several B&W antennas. What they need to work better is to put 2 feet of rod under the coil and have the feed insulated from the mount. I also cut that mount in half and added 18 inches to keep it away from the buildings brick wall. I also bent the coil of the mount so that the antenna was straight up and vertical. Every morning I got up around 4 AM and used my old MFJ CW rig from a SLA battery and one morning I was right on the grey line and worked Australia and Egypt. Later I purchased the Budd vertical and mounted that on the B&W mount. Later I replaced the telescope whip with a 58 inch long stinger. Take your time and use one coil clip for each band and move it around for lowest SWR then fine tune by adjusting the counter poise wire. However I found that cutting a counter poise wire for each band is much better. If you can you should mount the antenna at the top of the window then tack the counter poise wire to the wall. By moving the counter poise wire up and down you will see the SWR change so when the meter reads ZERO,tack it there. A ham in NC. Was running 50 mils of RF from his beacon and he received a qsl card from New Zealand so don't give up. Bob. AF2Q

receiving shouldnt be much of a problem but getting out esp on 40 m with an apartment antenna

might be a problem.
like i mentioned earlier with a 5watt cw only rig maybe something clandistine could be rigged up

so noone would notice it.

Steve,
I have been using a mag loop for several years
Even built several
The narrow band width doesn't bother me but most other don't like it
It nulls out QRM and causes no TVI at all even if I run 100 watts to it.
It's in the bedroom all set up just resting on a dresser drawer in a
horizontal position.
I have nothing but steel around me but still go over the pond with 5 watts.
Sudan is my best 5 watt contact on the mag loop with 5 watts

1871. bbw paddle arrived

Yahoo group: pfr3_group
Date: 2010-12-25 05:37:09 UTC
From: arthur
Topic: 1871 Message: 1871

i just received my bbw "baby black widow" paddle kit
its partialy completed and i think its a great unit
i finished the brass using 180 grit and then 1000 grit aluminum oxide paper. gave them a final hand polish using bar keepers friend.
smoothed the plastic paddle edges using 1000 grip paper too
the edges are a bit rough from the laser cutting.
remember to cut the 3/4" spring accurately down to 5/8"
as mentioned in the instructions and carefully bend the pointed cut end flush.
also you have to scrape a bit of the anodizing off the counternubk holes so that the screw heads make contact with the aluminum.
will report back when i get the silver plated screws that were on back order ""jerry says they are in the mail"
after xmas im planning to buy my pfr3a.
the key is larger then the hendriks
but will key virtually any electronic keyer or keyer equipped rig.
i will have to compare it to my mfj/ bencher keyer.
im into machining and i couldnt make his kit for $46
delivered to my mailbox.
"brass is expensive and so is short run anodizing"
i dont have any personal cnc experience.

There are several opinions on comparing the Black Widow to the Hendricks paddle. The Black Widow is much heavier with a more solid paddle feel. It is also much larger and a beautiful piece of equipment. The Hendricks paddle is very light and quite small. Unlike the Elecraft KX-1 paddle, it is mechanical not capacitive. As I was looking for a radio and paddle that were both small and very light for backpacking I chose the Hendricks paddle, have used it extensively for over seven months with my PFR-3A and would not even consider changing. I usually send and receive 25-28 wpm with no problems. For other radios I use a Bencher, a Kent double paddle and a Vibroplex paddle. Paddle choice is kind of a personal thing.

Keith,

Are you referring to the Black Widow Paddle or the Baby Black Widow paddle made especially for the PFR3? The Baby Black widow is not especially heavy as it is made of an anodized aluminum base/ front bracket and brass arms/contacts. The weight is something like 6-7 ounces. I know of several backpackers who have chose to carry the extra 3-4 ounces in order to have a better paddle.

Jerry,

Guess. I'm weak! Looked at the Baby Black Widow at Dayton this year when I bought my PFR-3A kit. Just liked the little Hendricks paddle. Was not impressed with the Palm for the PFR-3A but it might have been good for my FT-817. Like I said paddles are a very personal think. I'm amazed at the hams still using bugs. I have a Vibroplex bug and have never mastered it and I've been at this for 48 years.

I do not know. The BBW is more of a conventional paddle and it should be easy to switch back and forth between it and my wonderful Kent paddle. We are too old and infirm to do much packing so every ounce does NOT count. Mostly hope to pack a picnic lunch and have a few hours of leisurely operation and a few miles of cycling.

Keith,
Are you referring to the Black Widow Paddle or the Baby Black Widow paddle made especially for the PFR3? The Baby Black widow is not especially heavy as it is made of an anodized aluminum base/ front bracket and brass arms/contacts. The weight is something like 6-7 ounces. I know of several backpackers who have chose to carry the extra 3-4 ounces in order to have a better paddle.

Subject: Re: [pfr3_group] black widow kit

There are several opinions on comparing the Black Widow to the Hendricks paddle. The Black Widow is much heavier with a more solid paddle feel. It is also much larger and a beautiful piece of equipment. The Hendricks paddle is very light and quite small. Unlike the Elecraft KX-1 paddle, it is mechanical not capacitive. As I was looking for a radio and paddle that were both small and very light for backpacking I chose the Hendricks paddle, have used it extensively for over seven months with my PFR-3A and would not even consider changing. I usually send and receive 25-28 wpm with no problems. For other radios I use a Bencher, a Kent double paddle and a Vibroplex paddle. Paddle choice is kind of a personal thing.

I have large hands so I prefer something more substantial then the Hendricks.
im not a fan of capacitive paddles
about 25 yrs ago a friend of mine who is also a ham built a microprocessor based heathkit keyer
and wondered if id like to build up the same kit.
at the time i wasnt an active ham and didnt even still own my drake tr4 .
i didnt like the capacitive paddles "the elecraft uses capacitive paddles a bbw designed for the elecraft is availible . even out pfr3 bbw could be used on an elecraft with an extension cable.
for the price the bbw kits are a bargain.
with better paddles the full sized black widow is a bit more money.
if i like the bbw maybe i will use it on my full size rigs too.
my tr7 dosent have an internal keyer but my kenwood 950sd does.
i have seen videos of qrp operators using full size paddles like a bencher when running their
little qrp rigs.
the bbw might be a nice compromise.
buy one jerry is monitoring this group if you need any building questions answered
and i will post mine in the pic section when completed
i did a mediocre job of finishing it. "i never had the shiniest brass when i took rotc in high school
after 1 yr of it they told me to transfer to regular gym class. its about as shiny as commercially produced lacquered brass lamp parts. thasts way below rotc levels

I do not know. The BBW is more of a conventional paddle and it should be easy to switch back and forth between it and my wonderful Kent paddle. We are too old and infirm to do much packing so every ounce does NOT count. Mostly hope to pack a picnic lunch and have a few hours of leisurely operation and a few miles of cycling.

the discussion over the BBW and the PRF3 paddles is almost like comparing the old saw - apples to oragnes. yes , both will accomplish keying a radio. However, each do it in their own individual way, and each have their good points and their "brass" points.
On the one hand the PRF3 paddle is light and tuff... can take a fair amount of beating and still be usable. Can be repaired with a pair of pliers and a screwdriver in absolutely necessary. The BBW may take the same beating and not even need adjustment, and yet, the feel of the bbw is lost when having to wear gloves, so if it is a cold mountain top, with no heat, and in the not nice environment, maybe the 3's paddle would be better.. if you camp, maybe in a tent, with a bit of heat, the bbw may provide a bit more quality of feel... They each do a doggone good job of keying the radio... I prefer the bbw, on the bench, in my grab to go radio, mobile, both in the truck and on the motorcycle, however, if I am camping with the Boy Scouts, I will prefer the PRF3s paddle. Both because I will take the 3 and its paddle... the other radios may or may not be a 3..
So.. to sum up, maybe it is like choosing an antenna... a decision needs to be made as to how you want to use it. Then you can readily choose the one that does the best job.

I finished my bbw tonite "the screws arrived today"
the bbw works quite well and im testing it by clip leading
the terminals from a female stereo connector to my mfj422 keyer that has an integrel bencher paddle
sitting on my bench the key is a bit light weight for my heavy touch.
but seems to key as well as the bencher.
im not a very high speed cw op and still operate it like a bug that makes its own dashes.
many years ago i had a vibroplex paddle and a very early transistorized hallicrafters keyer.
i have a heathkit very old keyer that uses a side paddle too.
i never used the full sized black widow so i have no way
of comparing it to the bencher.
"the bencher weighs a ton which is good for fixed bench operation "probably a steel base"

Topic: 1884 Message: 1884

has anyone purchased the battery level kit that can me incorporated into the pfr3 or even used for any 12 vlt or so
voltage level indication..
is it hard to install it into an assembled pfr3??

1885. multiband qrp antennas

Yahoo group: pfr3_group
Date: 2010-12-28 10:48:18 UTC
From: arthur
Topic: 1885 Message: 1885

ive been thinking about designing a multiband qrp "40,30 and 20m"
dipole for use with the pfr3
a dipole with balanced feed is nice because no counterpoise is required.
i have a grid dip meter and a q meter too
so making up low power traps should be quite easily done.
could feed it with 300 ohm tv type twin lead or maybe even
light weight line with homemade spacers.
antennas like the "miracle whip" have very poor transmitting preformance.
ive been reading prior post lamenting the lack of simple indoor antennas or throw out the window antennas
at 5 watts something very thin and clandestine could be constructed.
remember in an hf mobile applications the car body is the counterpoise.
i have a 40 meter dipole made up using 2 horizontally mounted hamsticks i was driving it using my drake tr4
using rg58 and a homemade coaxial balun.
look at how lightly constructed the tuner is in the pfr3
it dosent take much to handle 5 watts cw "about a 30% duty cycle".

The BSE from Hendricks fits well, and works well in the PFR3. I've put a number of them in for folks. If you add one more switch, you can use it accurately on the internal 9.6 and on the external 12v battery, however, it would not be advisable to use the radio on a wall wart after that mod.

That really a nice compact antenna.
I don't know where to get a roll of the computer wire but Radio Shack has
the 4 conductor rotor wire selling for $18.99 for a 100 foot roll.
I just have one question.
What happens when you want to mount the antenna higher?
Or your property only allows you to mount it much farther away from the
shack and you now need 50 feet of feed line.
I assume this is more of a super light weight portable OP's antenna

i think the computer wire is standard ribbon cable like used to hook things up inside of an older pc
the newer ultra ide ribbon is shielded
you could buy a roll of ribbon cable from mouser or digikey if it has more conductors just strip it down like a piece of zip cord.
a very long feed line to the dipole/ doublet might cause capacitance problems.
i can measure even low capacitances so that can be accertained
real tv twin lead has very low interconductor capacitance per foot.
they made some very low loss foam stuff that was exceptionly low.
for hf i would just use the cheap plastic stuff like radioshack sells.
if the capacitance is excessive you might have problems tuning up on 20 m
he specs it as a 40-10m antenna that will work with the norcal blt
as i mentioned earlier my emtech , the pfr3 and the hendicks blt tuners are based on that nor cal design.
maybe on 20 m you could use a 50 ft feed line and get away with it.
maybe have more then 2 dummy wires between the signal lines will decress the capacitance.
i believe this design was optimized for the tuner.
it actually a form of "zepp" antenna.
believe me the kx1/ elecraft internal tuner wont be able to handle it like most autotuners they are designed to match a 3 to 1 swr to a solid state transmitter
my old drake tr4 would do that with no tuner. i use mfj tuners "non qrp"
and the emtech i think the hendricks kit is better constructed then the emtech which i built several years ago.
a real ham knows how to use a tuner and tune up a transmitter with a pinet output.
from what im reading going with a pfr3 vs kx1 is a very good decision
in the old days ham band only stuff normally worked better then general coverage stuff.
i had an em40 tranceiver that had a variable selectivity crystal filter like elecraft uses
it needed an audio filter which is an option i didnt purchse to be good on cw the pfr3 has an audio filter as standard + a 4 pole xtal filter.
i started out as a novice in 1969 with a heath hw16 that my late father and i built.
it out preformed all the low end stuff on the market ----- Original Message -----

Almost any parallel conductor cable should work. This summer I needed to make a quickie antenna for a QRP outing. I went to RadioShack and bought 50' of speaker wire (like light weight zip cord)and made a NorCal doublet. The doublet tuned great with the PFR-3 tuner.

I have been a fan verticals since the 1960's. I have a modified MP-1 vertical that I use for QRP and QRO portable operation. I changed the whip to an MFJ 12 footer and added a tripod from Blue Star antennas.

I had a chance to compare the antennas during a ham radio demo for the Boy Scouts. The vertical was ground mounted and the doublet was up about 20'. A 20' crappie pole supported the center of the antenna and the ends was up in some trees. The doublet won hands down - signals were a good S unit stronger on the doublet. I was using an FT-857 and an MFJ tuner.

I am sold on the Norcal doublet.

i believe that on 4-30-20 meters you can have a 50ft feed line.
the original antenna was designed for 40-10 meters im assuming that the capacitance between feed line wires limits the length of the feed line.
the wire he is using looks to me like 4 conductor computer ribbon cable.
simply stated if the antenna cant be matched to the pfr3 then the feed line is too long
"i believe im right"
my kit hasnt been delivered to me yet after i build it up then i will be able to acertain what its matching range is
i wonder how quickly hes shipping kits out?
my customers want instant shipping.
i will have to get some 4 conductor ribbon cable and measure the capacitance.

Thanks for the information.
I don't know for sure but I was told there is shielded ribbon cable.
Not sure if it would help with tuning.
Anyway my end fed I like because I have 5 strung up in different areas so
I just pull up with my wagon and grab the wire and secure it to the end fed

i believe that on 4-30-20 meters you can have a 50ft feed line.
the original antenna was designed for 40-10 meters im assuming that
the capacitance between feed line wires limits the length of the
feed line.
the wire he is using looks to me like 4 conductor computer ribbon
cable.
simply stated if the antenna cant be matched to the pfr3 then the
feed line is too long
"i believe im right"
my kit hasnt been delivered to me yet after i build it up then
i will be able to acertain what its matching range is
i wonder how quickly hes shipping kits out?
my customers want instant shipping.
i will have to get some 4 conductor ribbon cable and measure
the capacitance.

1901. doublet antenna

Yahoo group: pfr3_group
Date: 2011-01-04 11:18:33 UTC
From: SteveB
Topic: 1901 Message: 1901

the doublet ant is a suberb antenna there has been many articles written on the subject which boils down to this any lenth of feedline to 33ft each leg will tune 80 - 10 easy 64 ft each leg will include 160m wether it is fed with 75 300 450 or open wire feeder 3inch-6inch spaced approx 600ohm feedline a good tuner is needed to acheive a good vswr match the only consideration to watch is comercial tuners tend to be fitted with 4-1 balun to open wire conectors change as required to your needs happy new year to all

Guys, we are not talking about the Baby Black Widow paddle. We are discussing the paddle kit sold by Hendricks which is similar to the Elecraft KX-1 paddle. However, the Hendricks is not a capacitive paddle. It has contacts. I hope They find another machinist. It's a nice paddle.

1915. PFR3a Tuner Issue

Yahoo group: pfr3_group
Date: 2011-01-11 04:34:53 UTC
From: Joel Meddings
Topic: 1915 Message: 1915

I just finished my PFR-3a, and put it through a short workout during the North American QSO Party this last weekend. I am very impressed with this little rig and had a lot of fun with it. It transmits and receives very nicely. I cannot, however, get the LED to dim while using the internal BLT tuner. If I run the output from this radio through an external antenna tuner, the LED will dim and go completely dark easily. I am wondering if I have an issue with the windings on coil T3. I thought I'd get some opinions from the group before I get back inside the rig. All in all though, I really like this rig and look forward to taking it outdoors, i.e. FYBO.

Thanks everyone, and 73

im still waiting for delivery of my pfr3a kit
but i read the manual
tell us about the antenna you are trying to tune with the pfr3a internal tuner
what is the external tuner that works with your antenna.
you could test your tuner by putting lets say a 300- 500 ohm resistor across the output
setting the switch to high impedance and see if you can load up to the resistor.
or lets say a 50 or 75 ohm across on the low impedance setting.

just don't use a wirewound resistor " unless its a special non inductive type"
get some 1/2 watt carbon films from radio shack and put them in parallel or series to handle 5 watts
"thats the easiest way to check the internal tuner.
"does the group agree"???

Joel,

I thought the same thing and mine was one of the first kits sold at FDIM. There are notes on the reflector re changing the windings on the tuner toroid, but after playing around with the radio a little more I found that the tuner worked fine. The dip is very sharp at times on different antennas. Try it in a dark room first and go very slowly through the tuning sequence. I have kept my original windings on the toroid and am happy with the results.

Dave,

I found exactly the same thing - tuning is sharp, and and I found tuning on 30m and 20m takes more care than 40m -- for the antennas I have tried.

For example, tuning a 50 ft doublet "Sharpness" of tuning shown for 40m (at 1:40 mark in video), 30m (at 3:39 in video) and 20m (at 8:55 in video):
http://www.youtube.com/user/NG9D?feature=mhum#p/u/2/qaUN9m2u1pQ
The doublet, including feed line, is made out of two 75 foot long pc of 20 ga. wire, no soldering, held up in an inverted-V arrangement by a PVC tube.

I built my tuner per Steve's instructions. Detail photos of SWR bridge torroid T3 at 1:50 mark in this video:
http://www.youtube.com/user/NG9D?feature=mhum#p/u/5/wJs2iYGd-VA

Seems to be very adaptable tuner, also works well with an end fed wire (34 ft wire, 15 ft counterpoise):
http://www.youtube.com/user/NG9D?feature=mhum#p/u/22/3kWvXJ_5XgE

The antenna I started off with is the G5RV that I use for my main HF rig, and the external antenna tuner is the MFJ Deluxe Versa Tuner 2. I simply connected my PFR3a to the MFJ same as I would my main rig, and by tuning the MFJ I can get the PFR3a LED to dim and go completely dark easily. I think I'll try an end fed half wave wire antenna next to see if there is any difference with the BLT tuner. Thanks for the additional suggestions.

following the wrap on the pictures in the manual wasnt the correct spacing?
the power levels are low enogh so that compressing the windings isnt a big issue.
"might be on a 1 kw balun"

I had to compress the windings to get it working on 40. The other bands were OK.

i have an mfj versa tuner and it has a huge tuning range.
the only problem with the versa tuner is that with a high power rig like the drake tr4 i had
and a poor antenna match i was able to melt the tank coil plastic seperators in it.
"i bought a new assembly from mfj and replaced the fiber insulating washers with teflon ones also from mfj your tuner is newer so it probably has the teflon washers and improved switch.
the g5rv is a coaxialy fed antenna but with one side grounded the pfr3 dosent care.
im assuming you were using the low impedance setting on the pfr3?
im not sure what the actual impedance of the g5rv is.
the tuner in the pfr3 isnt spec'd 6 turns high 2 turns low? so there is a 9 to 1 impedance ratio
between low and high settings?
makes sense too 50 ohm coax to 450 ohm ladder line

From: Bert Thompson
Topic: 1901 Message: 1923

Steve,

I'm here in Denver baby sitting the grand kids and renting a small cottage with the xyl. The attic is exactly 44ft long. Well could not fit my "carolina windom" up there. So I built a double antenna "aka Norcal 40". I went up the street to the local hardware store and bought a 50ft. roll of lamp cord. Stripped down 22ft. yielding 44ft. and attached the remaining unstripped 28ft. in the center of the attic and the stripped ends to either end of the attic. Then attached the feed line to a 4:1 balun and connected 50 ohm coax from the balun and down the heat duct to the shack; works great. I use an Elecraft T1 tuner with my PFR-3 and have worked alot of qso's and contests. Not the best setup in the world but okay under the present conditions.

the doublet ant is a suberb antenna there has been many articles written on the subject which boils down to this any lenth of feedline to 33ft each leg will tune 80 - 10 easy 64 ft each leg will include 160m wether it is fed with 75 300 450 or open wire feeder 3inch-6inch spaced approx 600ohm feedline a good tuner is needed to acheive a good vswr match the only consideration to watch is comercial tuners tend to be fitted with 4-1 balun to open wire conectors change as required to your needs happy new year to all

1924. BLT Tuning Issues fixed

Yahoo group: pfr3_group
Date: 2011-01-15 05:09:14 UTC
From: Joel Meddings
Topic: 1924 Message: 1924

Hello again everyone-I had posted a problem to the group recently concerning the fact that I could not get the swr LED to dim and go out while tuning the BLT tuner on my new PFR3A. I received several very helpful suggestions. The one post that was the most helpful was one that included a link to several YouTube videos produced by NG9D. If you haven't seen these yet, these videos cover both construction and operation of the PFR-3A. As I was watching one, I saw how NG9D was able to peak the signal by adjusting the tune and load capacitors before tuning the BLT. And I recalled that in the instructions for the PFR3A, it is clearly stated that these capacitors should be adjusted for best signal strength. I could not do this with my PFR3A, and that was my real indication that there was a problem. I opened up the rig and looked around, and sure enough I had missed a connection between the antenna switch and the coax connector. This was one of the last steps in the construction process, and I remembered that I had been up late that night trying to finish the build, and simply missed this connection. Anyway, the rig works great now, and I have already made several contacts with it. The PFR3A is very fun to operate and I am very happy with it.

I wanted to post my story to the group in hopes that some new builders out there might learn from my mistake.

Lesson 1 Be sure to double-check your work, and stop before you get tired and lose your concentration.

Lesson 2 Don't hesitate to ask for help-there are many smart fellers in this group who are glad to help.

Lesson 3 Don't always assume that a problem will be difficult to trouble-shoot or fix. I have built several kits over the years, including heathkits, Elecraft K1, etc. 9 times out of 10 if there is a problem, it will be simple and easy to fix if you just take a few minutes to think about what is working, what is not working, what you've done, etc. Then if you can't figure it out, refer to Lesson 2.

Finally, if you haven't seen the videos by NG9D, by all means do so. They are well done and very interesting and helpful.

Thanks to everyone, and hope to work you on the air

From: jonathan.thomson62
Topic: 1926 Message: 1926

I am just about finished with group 1. It seems as though the front lug on the stereo jacks is slightly larger than the hole in the board. Of course, I can file the lug a bit but I first wanted to make sure I was not missing something in the assembly of jacks.

Thanks,

Jonathan

I also ended up having to ream out the holes in the enclosure for mine.
They were a bit too small.

The holes on the ones that I have built, have had the thickness of paint get in the way. The holes tend to gather a bit of extra paint, thus "growing" smaller, in a fashion. Clearing out the extra paint will usually clear the problem. I wouldn't mess with the jacks, their integrity needs to be a strong as possible. Hate to have one fail at the most inoppurtune time.. and you know Murphy will attack the weak spot.
Good Luck,

Thanks OM - looks like a great kit but I have too little time and 3-4 other qrp kits awaiting to be built too. I want to start on something simpler - already built the Pixie II, Rockmite, and NS-40. Now working on SW-40 and SW-30 and have a 2n/2 - 40 (Norcal) also awaiting in the cue (that appears pretty challenging too- approx. 300 components). So my plate is full and I suspect that someone else might enjoy building this one now. Never say never, as I may end up not selling this one and eventually building it later.... once things settle down in terms of work committments.

1939. Koch Method

Yahoo group: pfr3_group
Date: 2011-01-21 20:56:29 UTC
From: Richard Powers
Topic: 1939 Message: 1939

Gents;
Well, since I will soon get my PFR-3 I figured I'd better get busy with the code.
I started with the Koch Method default 25 wpm Char & Code speeds & immediately found that I couldn't write (print) that fast and have toned that down to 25 wpm Char Speed & 15 WPM Code Speed & I still can't write that fast.

Now I don't think I should go any slower than that so I am wondering if I should go ahead & try to just copy in my head.
(I initially learned up to 13 WPM back in the '70s but never used it.)

Any other ideas out there in PFR-3 Land?
Dick WB9PWQ

Try typing - you can typically type a lot faster than writing long hand.

Contesters enter data in contest logging programs that way.

Gents;

Well, since I will soon get my PFR-3 I figured I'd better get busy with the code.

I started with the Koch Method default 25 wpm Char & Code speeds & immediately found that I couldn't write (print) that fast and have toned that down to 25 wpm Char Speed & 15 WPM Code Speed & I still can't write that fast.

Now I don't think I should go any slower than that so I am wondering if I should go ahead & try to just copy in my head.

(I initially learned up to 13 WPM back in the '70s but never used it.)

Any other ideas out there in PFR-3 Land?

Dick,

My code speed is between 25 and 35 wpm, depending on what is being sent. For my contesting I type. For general rag chewing I just copy in my head and take occasional notes. I can't write or type very fast either.

I am assuming you've not forgotten Morse entirely. If you did it once, I don't see why you can't do it again. I'm aware of the Koch and Farnsworth methods, and the differences between them. Herr Koch's seems to be for beginners, startng from scratch. Farnsworth's is a style that may make it easier for a person to copy slightly higher speeds. Don't worry about the speed, just get immersed in CW. I always have a radio on the background, on some active CW frequency, and copy in my head. In day to day CW work, groups of characters become more recognizable at higher speeds than individuals letters. If I do copy, I find myself a few letters behind the actual text. I wonder how many Ops actually copy "my QTH is Chicago, Il ..--.. Chicago, Il" Or just scribble CGO. The last time I copied solid was in 1980 or so, at the FCC office. Then, you could either hand in 1 minute solid, or take a 10 question test based on the CW sent.
Try one of the QRP sprints or contests. You'll be surprised at your terminal CW speed.
Try casual QSOs on a clearer band, where there's less distraction and anxiety. Hope this helps.

try JUST LEARN MORSE CODE gives total control of speed and spacing
also play text file with common qso type words? numbers remember most qso,s are rubber stamp rst name qth 73 try it 25wpm for words with farnsworth spacing at 12 wpm that way you will copy in ear 73

Nowadays, just taking notes like in a lecture class should do just fine. In the good old days when FCC exams required one minute of solid copy, I stayed away from methods that may jeopardize my ability to do that. Once I cleared the 20WPM test for the Extra license, I figured my testing days were over. So notes, abreviations, copying in my head etc took over.
By the time I took that 20wpm test the rules had changed and one minute solid copy was no longer required. I think someone had the foresight to realize most of us cannot write that fast.I was borderline and the fastest my pencil would work was about 21 or 22 wpm.
 Anything faster had to be headcopy. Until I got into Radioman A school with the US Navy.
 Then it was mill copy and I made it to 26 wpm before the school expired.
And it only took a few days to get accustomed to using a typewriter isntead of pencil.
Never took to trying to copy solid beyond that. Headcopy has prevailed.
But shame on me for not trying to go behound 30 wpm with good copy. Mostly I still copy letters instead of words. I think.   I am approaching 70 years old so i need to take on a mind exercise to keep it working.

you are welcome dick i think i posted this before on this or another forum sadly im a little deaf to many years in heavy engineering started learning cw about 5yrs ago and failed miserably until i found an article which explained my problem trying to count dots and dashes and losing place so on the writer an american cw enthueist said can you copy at 35wpm ? most people would say NO send cq at 12wpm then at 35wpm still copy instead of learning code in individual letters learn words longest in rubber stamp qso NAME or your qth which you send slowly so other station can write it down same thing with callsigns lay out a text file with cq qso name and so on repeated several times and playback at 30wpm and you will see what i mean any way good luck

I copy reasonally good at 20 to 25 wpm. I'll listen in on a contest the last couple of hours to see what I can pick up. It always amazes me the ops sending unanswered CQs endlessly at 40-50 wpm. If they would occasionally cut their speed in half they would find more takers. I taught my 3 boys code by making simple words out of the simple characters, e, t, o, m, s, i, etc. and gradually introducing the more complicated letters. Being able to copy some words after only a few minutes makes it more fun for them and builds their confidence. After they can recognize the characters it becomes an issue of practicing every day for a half hour or so.......John, KO0D.

Agreed on code speed while contesting. I have found that 28 wpm works best for me. In a 48 hour contest such as ARRL CW in Feb. I will rarely have to repeat the report or call more than 6 or so times. And those guys would probably have trouble copying at the old 13 wpm.

Subject: [pfr3_group] Koch Method

Gents;

Well, since I will soon get my PFR-3 I figured I'd better get busy with the code.

I started with the Koch Method default 25 wpm Char & Code speeds & immediately found that I couldn't write (print) that fast and have toned that down to 25 wpm Char Speed & 15 WPM Code Speed & I still can't write that fast.

Now I don't think I should go any slower than that so I am wondering if I should go ahead & try to just copy in my head.

(I initially learned up to 13 WPM back in the '70s but never used it.)

Any other ideas out there in PFR-3 Land?

Dick WB9PWQ

1954. 1000 common words

Yahoo group: pfr3_group
Date: 2011-01-26 17:03:42 UTC
From: Richard Powers
Topic: 1954 Message: 1954

There is a text (Notepad) document out there called 1000 common words.txt or something very similar. My problem with it is I would like to have it in Random Order in stead of Alphabetical and I can't un-sort a Notepad file.

Anyone know how to Randomize this file?

Thanks,
Dick WB9PWQ

Hi Dick,

One possible solution is to use your txt file as entry to CWPlayer (from F6DQM). From there you can play, generate and record as you like.

Also the program "Just learn Morse Code " from LB3KB works great.

From: Steve
Topic: 1954 Message: 1956

Import the list into a column in Excel
Create a 2nd column adjacent to the words, fill each cell with a random number using "=rand()"
Sort both columns on the random number, which effectively randomizes the words.
Delete the random number column.
Save-As a text file to convert back to text

Just one idea...

Put it into a column in excel
In the next column use =RAND()
then sort on that column

You can then delete the second columb and get it back into text if you need

All:

I was having the same issue Dick was having. Randomizing the words makes for much better practice. Steve's method works like a champ.. I kept sorting (3 times in a row) to get a better 'blend'. I saves the file as a MS-DOS text file and it works perfectly.

Thanks Steve. Very helpful.

If copying random words is too boring -- try CNN news bulletins in Morse code.

15/13/10/7 wpm code at:

http://cw.dimebank.com:8080/CNNslow.m3u

and

30/25/21 wpm code at:

http://cw.dimebank.com:8080/CNNfast.m3u

The bulletin today included news on the Moscow airport. Always "599" day-in and day-out. And, as an added bonus, you will get very good at punctuation marks!

I learned/practice code using random letter/number groups which prepared me for the, then FCC administered, code test that required you to do perfect copy and they would throw in some intentional errors. That was then. If I was learning the code now I would use words, simulated QSOs, etc. That will teach you to copy in your head and then write down notes for comments and the logbook. In a QSO you don't need to write down "the name here is Joe". You need to copy it in your head and write down "Joe". My 2 cents. John, KO0D.

this is k9dta
my unit is up and running and i made a contact this afternoon between me and michigan on 40m
who wants to try a qso with me on 40 or 20m
my antenna is a mosley multi band verticle about
30 ft up on my roof peak.
i can load up on 30 but i dont know how efficient the antenna is on 30m
"i will have to check it using my antenna noise bridge"
it does tume up fairly well using a tuner on 17m
my radials are optimized for 40 and 20 m
it has a 80m kit but isnt very efficient.
if the band is poor i can always switch over to my kenwood and run 50- 400 watts

1968. Calibrating the pfr3

Hi Ren,

Contrary to what is stated in the manual, if you own a receiver with an S-meter that will receive WWV on 10 MHz you can get the reference oscillator very close (within cycles). Skip the I.F. offset adjustment. Do the BFO adjustment as stated.

Best of luck with your kit.

Hi Ren,
If you want to, when you get ready for the calibration, I'll call you to talk you through it... or.. if you want ship it to me, I'll calibrate it, all that would cost would be the shipping, and the PFR3 ships via USPS for near $5 one way.
Calibration is a snap tho, like Steve said, if you have access to a rx that can hear WWV on 10 mhz.

Yahoo group: pfr3_group
Date: 2011-02-01 00:03:03 UTC
From: James
Topic: 1968 Message: 1971

I basically used the procedure described on this webpage. It takes a second radio that can receive WWV 0n 10 mHz that is connected up to a PC with Digipan or other digi software. Hook up the short wire as described in the PFR-3 instructions. Use ssb or cw mode and center wwv carrier on the waterfall. When you power up the PFR-3 another strong carrier will appear on the display. Zero-beat the two as described in the PFR-3 inst. and store. You will also need a cable with male plugs on both ends to hook the PFR-3 up to the soundcard of the computer. Then the waterfall display is used to set the BFO trimmer.

I "worked myself" using the PFR-3 into a dummyload and my big rig turned down to minimum power. The freq. was right on, within 0.1kHz.

....or get Dale to do it; he has much knowledge on this rig and has given me good advice.

Ren,

The only calibration I did was to get the radio on frequency. I borrowed a frequency counter from Notre Dame to do that. However, it was so close originally that it was probably a waste of my time. If you want to try it with the frequency counter it is very easy. I gosh darn guarantee you will love this radio.

Hi Jonathan,
I don't remember any changes for those three caps being called for. I'd want to keep in order with the schematic, and parts list. The value is pretty much a done deal. If you don't have any "extra" different caps, then I would follow James suggestions, either check with Doug Hendricks, or a local supplier (Radio Shack) or some such, thinking that it would be quicker. However, if you want to wait, you could leave those out, and progress with the rest of the assembly, while the caps arrive. I've looked, and don't have any in stock. yet.
Good luck,
and James, thank you for the compliment, you're a gentleman and a scholar, sir.

I concur with the others; get the correct cap's..

If they were simple power line bypasses it would hardly make any difference but in this case C54 will affect the PA on/off timing (keying) and the other two are in the feedback loop of the 2nd audio stage. A change there to .022 might make things sound 'funny'.

Have fun building your kit.

the 2 tones beating against one another can be easily done by "ear"
when you get close wa wa wa then adjust for minimum beat frequency i was able to get down to about a a 1 hz error between the tones.
beating the 10 mhz test poing signal against wwv at 10 mhz should work well
dont use any wwv except 10 mhz so you will have to pick a time and day when wwv is strong and clear on 10 mhz.
"depends on path length to colorado"
he sent me the wrong value caps too fortunately i had some new .01 film caps in my collection of parts. i accertained to that changing the parts value to .022 might cause problems.
i think the rig would work with the wrong value caps but it would knock the audio filtering way off
and as he said slow down the qsk switching. "the rig has very good qsk operation"

Subject: [pfr3_group] Re: Calibrating the pfr3

I basically used the procedure described on this webpage. It takes a second radio that can receive WWV 0n 10 mHz that is connected up to a PC with Digipan or other digi software. Hook up the short wire as described in the PFR-3 instructions. Use ssb or cw mode and center wwv carrier on the waterfall. When you power up the PFR-3 another strong carrier will appear on the display. Zero-beat the two as described in the PFR-3 inst. and store. You will also need a cable with male plugs on both ends to hook the PFR-3 up to the soundcard of the computer. Then the waterfall display is used to set the BFO trimmer.

I "worked myself" using the PFR-3 into a dummyload and my big rig turned down to minimum power. The freq. was right on, within 0.1kHz.

....or get Dale to do it; he has much knowledge on this rig and has given me good advice.

From: arthurok
Topic: 1972 Message: 1980

from looking at its manual the pfr3a has allot more parts in it then the kx1
i find that the receiver in the pfr3a has very sharp selectivity.
and its audio agc does work checking it with 10 db steps using my 8640b signal generator.
the variable bandwidth filter in the kx1"elecraft isnt as great as they make it seemm to be.
thats why its only a 3 crystal filter and why they have no audio filter.
the direct freq input works well and tuning is easy but when using the slewing scan
a weak station could easily be missed.
when im slewing i can hear a blip when i scan over a station atleast it dosent have muting that the cheap synthesized consumer stuff.has
the dds chip costs $21 from digikey its the key to its design
kx1 uses the same k1 is all analog.
i should design a digital class e linear for the pfr3a something qsk that dosent require an external keying line.
you know the kx1 only produces 1.5 watts on internal 9 vlt power
my pfr barely produces 5 watts on 40 meters and i measured the power using
a 100 mhz scope and good dummy load
its only drawing about 600 miilamps on a 12 vlt power supply.
the coils are properly wound too.
actually i like the lower current draw because im planning to run it mostly on alkaline batteries when in the field and a fused at 1 amp 11.45 vdc older motorola cell phone power supply
looks like its about 20 yrs old rated at 2.5 amps switching supply brick.
some guy was selling them to run cb sets.
detuning the receiver preselector control reduces blasting on very stron signals
im using a verticle whose tip is probably almost 60 ft up from street level
the receiver is fairly quiet because of its 4 pole xtal filter and active audio filter.
"anyone ever compare this to a kx1 or k1?"

Subject: Re: [pfr3_group] Green film capacitors

I concur with the others; get the correct cap's..

If they were simple power line bypasses it would hardly make any difference but in this case C54 will affect the PA on/off timing (keying) and the other two are in the feedback loop of the 2nd audio stage. A change there to .022 might make things sound 'funny'.

Have fun building your kit.

Subject: [pfr3_group] Green film capacitors
Date: Tue, 01 Feb 2011 00:19:09 -0000

I am currently making progress on the group 2 assembly. In the instructions it calls for .01 mfd capacitors (103 green film) for capacitors c22 and c23. C54 in group 3 is also listed as a green film .01 mfd. In my package are three green film capacitors but they are .022 mfd (223). Should I use these caps rather than the .01 mfd listed? Does it matter in these applications?

Thank you,
Jonathan

From: Andrew Cowan
Topic: 1984 Message: 1984

Hello all,

My main use of the PFR is SOTA http://www.sotawatch.org/

Which is great fun a good use of a light radio and 3 bands, part of the equipment I carry is a 5000ma lipo battery.
So I have ample power to supply the radio so I am looking for a way to increase the power to possible 25watts, with on board mod which I doubt or external small amp.
Anybody with ideas to boost the PFR and be able to use it for 2 hours with 5000ma battery.

Hope I am not upsetting the qrp guys? just want to maximise qso's while up the hills

Thanks

Andrew GM0UDL

ive been thinking about the same maybe i could come up with a simple qsk amplifier
that would work with our units because its cw only maybe it could be class e just like the
transmitter on the pfr3 qsk with no keying line would be nice so that a keying line dosent
have to be brought out from yhe pfr3
cw has a low duty cycle so that the average power draw will be fairly low.
the rig "hears well" but as you know the lower bands are noisy and the more power the
better
25 watts or so is probably a good number even 50 on cw is doable
the elecraft kx1 is only rated a 1.5 watts on internal batteries.

1987. Smoke test 2

Yahoo group: pfr3_group
Date: 2011-02-05 23:30:54 UTC
From: jonathan.thomson62
Topic: 1987 Message: 1987

I just completed group 2 and marveled at the reception on 40 meters in the middle of the day. In the past, whenever I used torroids they were situated flat on the board rather than upright as is the case with T1 and L1. Even with the leads tight the 30 gauge wire does not instill confidence with respect to physical stability. I have heard others mention the use of hot melt glue. Is there any problem with carefully using some hot melt glue around the bases to stabilize T1 and L1.

Thanks,

Jonathan

The physical strength of the wire will support the core without any issues. However, the stripping of the wire preperatory to tinning and ultimately soldering the coil into place is of the utmost importance. This is exactly where/how the wire is destined for failure or excellance. ANY tool used for scraping the enamel off, has the ability to nick the wire, a surface nick will be the point of failure, even when tinned over and soldered into the hole. This has be repeatedly tested so many times with the same result, it is an old saw now. So, use a hot iron to burn off the enamel, and pretin the wire at the same time. After installing well over 500 toroids in the AT3, 3b, and 4 filters and boards, the failure rate for toroids falling off the boards with the wire snug for support, without nicks, is a possible one. The downside of putting a dab of glue on each of the coils, is that they cannot be optimized when needed, easily. There is also a discussion that has occurred concerning the degradation of the tuning of the coils by the glue. I haven't taken the time to test for this, either long or short term.
I don't recommend the use of any glue on the coils, the return on investment is pretty slim vs the risks.

make sure that you soldered in a 2n7000 not something else in a to92 package
except for their respective part numbers all the small transistors look the same
you might have a bent pin on the miroprocessor chip too so it isnt making contact in the socket.

From: Petr
Topic: 1999 Message: 1999

Hi all,

just FYI that last of few kits of the rotary encoders are available. There is no plan to make another batch of kits as there are not so mni requests coming to Miroslav. So if You want to grab one of them then do not wait and send him an email with order to diy4fun@...

More information are available here
http://diy4fun.blogspot.com/2010/01/rotary-encoder-for-ats-transceiver.html

The rotary encoder is usable with PFR-3 as reported on this group already so do not hesitate to contact Miroslav in that case.

Good luck,

Topic: 2000 Message: 2000

Hello everyone,

I odered my radio about a week and a half ago and am looking forward to receiving it soon. In the meantime though I've been searching online for ideas on antennas for portable use. There's only about 55,0000 pages on the subject and my brain feels like oatmeal (I've only got about 37 more pages to go), so I'm turning to the group for suggestions on what you guys use for portable use.
Thank you,
Ren

Ren,
There's a lot of good to be said about a simple wire antenna, tossed as high as possible in local trees. They can be light-weight, uncomplicated, easy to build, and work well. This could be as simple as an end-fed wire: near end connected to the tuner and far end thrown into the trees. Or perhaps more elaborate: dipole with feed line hung with both ends supported or with the center supported (inverted V).

The "right" antenna will depend on the setting. A tree-less mountain summit would demand some sort of support, or a vertical antenna - but the complexity, weight, and expense increases.

Focus your reading, research and experimenting with wire antennas. The cost is low, while the value is high.

Thank you Steve,

I ordered a 500 foot roll of 20 gauge wire a couple of days ago, knowing that I'd probably be making antennas out of it for the children and myself. I really like Lynn's (NG9D) vertical end fed and the multi band doublet antennas. I'm going to have to come up with good support for these as trees are not plentiful where I'm planning my first outing.

Thanks again,

Ren

I have to agree with the idea of wire antennas, The PFR3 is designed to be a very complete and portable transceiver - not much that you need to add.

I have had great luck with 55 to 88 feet of very light wire hauled up into a tree as high as I could throw a rock and a very light nylon line. Add about 20 feet of wire lated out on the ground as a counterpoise and the built-in tuner tunes it nicely.

The same antenna also works pulled up to a balcony railing or up onto a roof of a building. You just need to get creative and bold sometimes.

You probably want to get the antenna setup and get on the air quickly and it doesn't take long to get a wire up into a tree.

I did build a poor-man's BuddiStick vertical that works pretty well if no trees or supports are available.

I found the more wire in the air, the better the performance,

Good Luck! 73

2004. RE:was- antenna recomendations for portable use; is: problem solved

Yahoo group: pfr3_group
Date: 2011-02-11 17:33:43 UTC
From: N. A. Monllor
Topic: 2000 Message: 2004

Well,

I've got great news as far as the support for a wire goes. I purchased some green fiberglass tubes on eBay quite a long while ago, they even came all packed up in some sort of green Army type duffle bag. Well, I dug them out of the attic and had some PVC pipe lying around the workshop that these tubes slide over neatly... the fit is like a glove. So I cut an angle slice into the PVC and made the piece about 18" long to use as a stake for the green tubes. Six tubes + stake in ground = about 24' of support. I pushed against the support with a fair amount of pressure and am convinced that unless it's a hurricane, it's not going anywhere. I have enough tubes and PVC two have two 24' supports in the ground providing me with a couple of options for wire configurations..problem solved.

Thanks for the replies,

Ren

I still can't get the proper reading at the L7 pad next to C57. Everything checks out ok and I even replaced Q5 with a new 2N7000 that I picked up today.

I would love to get this radio running before long. Any more suggestions.

Hi Tom,

Have you measured all the q5 and q6 terminals in RX and TX and if so, what were the results? If you give me those values, I can help you identify the problem.

From: orangelite
Topic: 2007 Message: 2007

I thought yall would enjoy this: a youtube clip of the PFR3 cracking a pileup to work S9DX on 20M (from Seattle).

http://www.youtube.com/watch?v=_dcTJMgUvG4

The part where I work him is about 3 min into the clip (if you don't wanna listen to a pileup for 3 minutes - I cant edit Quicktime vids yet!) I was running 2 watts to a G5RV up 75ft. He was REALLY booming in, the condx were perfect. I decided to try for "youtube qrp dxcc", that is, post my qrp dx efforts to a youtube playlist:

http://www.youtube.com/user/charangito#p/c/677A093C75EB5C5

The "little yellow" is truly a SWEET little radio -

Wow! Very cool John.☐ Africa/ S9DX [DD2ML , DK1AX , DL2JRM , DL7VEE, DM2AYO, DF1AL, DO2XX and DM5TI DXPedition] from Sao Tome and Principe Islands is great DX and that was a 599 signal report the DX station gave you! Oh, at the end of your video you said 2W? Even more impressive, were you intentionally running less than 5W? That is one of the best QRP demonstrations I've seen! Great job!! 73 de NG9D☐ . .

2012. pacific antenna pac 12 ; is pacific antenna still in business?

Yahoo group: pfr3_group
Date: 2011-02-19 05:11:13 UTC
From: arthur
Topic: 2012 Message: 2012

im thinking of building up a variation of the pac 12 antenna
pacific antenna did a very good job "commercializing" the home brew design.
with my lathe milling machine and cut off saw i think i could build one as good or better then what they did
the telescoping antenna they used is nolonger availible from radio shack so i have several options
#1 , get an mfj telescoping antenna
#2 get a 102" cb whip
#3 makeup a home brew teleescoping or multisection whip
the cb whip is a good idea if im just going to transport the antenna using my car.
a long piece of thin stainless rod clamped in place with set screws would work too.
the pac 12 is designed for 80-10m meter coverage
im just into something that will work with the pfr3
a cb 108" whip essentialy is a 10m 1/4 wave antenna
so is any cb antenna.
anything thing much shorter then 108" isnt going to be very efficient on 40 m.
hes using an alluminum mounting spike with a 1/4 20 threat when the spike is removed so it can be mounted on a standard photographers tripod.
i would make the spike out of 303 stainless.
sometimes getting if lets say 5 ftup on a tripod might be a good idea and the drooping radials might improve the match.
ive been looking at his wandering lead coil and wonder how good it is "anyone have experience with it?
getting good swr with a fixed loading coil is questionable
being able to vary the length of the whip helps allot
spillsbury made an antenna similar to the pac 12
but it had an adjustment sleave insted of a wandering lead.
im thinking of making up 1 loading coil for 40-30-20
with a 3 position switch.
we have built in tuners so perfect swr might not be an issue.
if not done properly the wandering lead approach can generate a shorted turn on a tight coil
thts why he uses a mini clip.

Arthur,

When building a vertical, the section below the loading coil is most important. The bottom 1/3 of a full size vertical produces 2/3 of the radiation. Therefore, you should concentrate on improving the lower part of the antenna making it as large as possible. The upper part tunes the antenna but does not radiate very much.

hhhmmmm So here is what I am considering. Use a 10 ft length of conduit and mount in one end a 3/8th 24 stud. Use an MFJ 10 ft telescoping whip or the CB fixed length whip. These two will screw together with a female coupler. With the whip fully extended, cut the conduit to length to resonate on 20m.
Then I can insert a loading coil between the two to tap to resonate on 40 and 30. The section below the coil would be around seven feet long.
Now then ..... should I make the section below the coil LONGER and shorten the stinger?

pole sells the whips at a decent price.

I built mine according to the homebrew plans and just put it through the antenna analyzer this week, the results were quite good, 1:1.

a long piece of thin stainless rod clamped in place with set screws would work too.
the pac 12 is designed for 80-10m meter coverage
im just into something that will work with the pfr3
a cb 108" whip essentialy is a 10m 1/4 wave antenna
so is any cb antenna.
anything thing much shorter then 108" isnt going to be very efficient on 40 m.
hes using an alluminum mounting spike with a 1/4 20 threat when the spike is removed so it can be mounted on a standard photographers tripod.
i would make the spike out of 303 stainless.
sometimes getting if lets say 5 ftup on a tripod might be a good idea and the drooping radials might improve the match.
ive been looking at his wandering lead coil and wonder how good it is "anyone have experience with it?
getting good swr with a fixed loading coil is questionable
being able to vary the length of the whip helps allot
spillsbury made an antenna similar to the pac 12
but it had an adjustment sleave insted of a wandering lead.
im thinking of making up 1 loading coil for 40-30-20

with a 3 position switch.
we have built in tuners so perfect swr might not be an issue.
if not done properly the wandering lead approach can generate a shorted turn
on a tight coil
thts why he uses a mini clip.

Sorry guys about the typo.

I meant to say that Buddipole sells the whips.

pole sells the whips at a decent price.

I built mine according to the homebrew plans and just put it through the antenna analyzer this week, the results were quite good, 1:1.

Henry,

That would depend on what efficiency you want/need. Since most of the radiation comes from the section below the coil, I would make it a long as possible for higher efficiency. As you place the loading coil nearer to the top, the coil inductance will need to be increased to resonate the antenna. To lower the inductance, try a top hat. On mobile installations we are usually limited to the size of the bottom section since it is the biggest wind catcher. Four to five feet is about all you can do on a mobile antenna for a bottom section.

hhhmmmm So here is what I am considering. Use a 10 ft length of conduit and mount in one end a 3/8th 24 stud. Use an MFJ 10 ft telescoping whip or the CB fixed length whip. These two will screw together with a female coupler. With the whip fully extended, cut the conduit to length to resonate on 20m.

Then I can insert a loading coil between the two to tap to resonate on 40 and 30. The section below the coil would be around seven feet long.

Now then ..... should I make the section below the coil LONGER and shorten the stinger?

Arthur,

When building a vertical, the section below the loading coil is most important. The bottom 1/3 of a full size vertical produces 2/3 of the radiation. Therefore, you should concentrate on improving the lower part of the antenna making it as large as possible. The upper part tunes the antenna but does not radiate very much.

id like to come up with a no tune verticle that will work well with our pfrs3's tuner without having to tune the antenna.
the power levels are so low that maybe simple can be designed.
a flimsy telescoping whip maybe isnt a great idea some pieces of stainless steel rod joined together using stainless of aluminum couplers and set screws might work just fine.
and using some tubing i could make up an adjustable length stinger "like used on a ham stick.
buddipole seems to be heavily connected with elecraft.
maybe i can come up with something and supply a low cost kit to the group.
he says the pac 12 is capable of 100 watts there is no need for that much capacity.
i commonly machine plastics mostly delrin and abs.
fiberglass rod with a helix wound around it and covered with heatshrink tubing works well too.

2019. True Overall Dimensions of PFR-3

Yahoo group: pfr3_group
Date: 2011-02-20 00:54:03 UTC
From: k2ytj
Topic: 2019 Message: 2019

I suspect the 7.3" x 4.4" x 1.6" dimensions of the PFR-3 given on the Hendricks site defines only the yellow case, not the case plus the extension including the connectors on the rear or the knobs on the top, which makes it difficult to spec out a container for transporting the xcvr in the field. (NOTE: I am not interested in the front to back dimension including the key, which I intend to remove and pack separately.)

Can someone give me the true front to back dimensions including the rear connectors and the bottom to top dimensions including the feet and the tallest knob? I assume the width of 7.3" is good?

I'm hoping it will fit in the MTM Survivor Dry Box with O-Ring Seal shown on Amazon, which sells for a scant $12.43! Inner dimensions are 8.2" x 5.0" x 4.4". See http://www.amazon.com/MTM-Survivor-Dry-Ring-Seal/dp/B002KENWZY/ref=sr_1_1?ie=UTF8&s=sporting-goods&qid=1298162298&sr=8-1

Thanks,frieds. 73s, Dennis K2YTJ

From: Dale Putnam
Topic: 2019 Message: 2020

the PFR3 case is 7.25 inches left to right, 2.5 in. thick, 5.75 inches deep. This will allow for the BSI switch also, if the BSI isn't installed subtract 3/16ths. This will be a loose fit into a comfy holder. The BBW paddles would add 3.5 inches to the 5.75 depth. And packing the key seperate is a very good idea. This is one of the few times that together we fail. I can pack the PFR3 and the BBW seperate in a saddle bag, ride across some very rough country, and still have a radio ready to play with, when I get to camp. Have a great day,

i like variable inductance coil concept.
maybe i can come up with some sort of a groved coil form and a slider like a variable resistor.
the problem with the wander lead is generating a "shorted turn"
i can cut threads with my lathe to hold bare wire having a slider with a scale next to it would be nice. a shorted turn dosent bother a wirewound rheostat.

a shorted turn is caused if the wandering lead clip touches more then the intended turn of the loading coil
thus causing a shorted turn transformer.
even thogh its an air wound coil the shorted turn will draw current.
many inductors fail when two adjacent turns fail
it lowers the q factor allot too.

Arthur,

There is no reason that the tapped coil must be shorted. Leave one end unconnected.

2026. Problems with Group 2 smoke test

Yahoo group: pfr3_group
Date: 2011-02-22 17:44:20 UTC
From: Ren
Topic: 2026 Message: 2026

Hello folks,
Group 1 smoke test: all went well except that I don't have Freq. Counter or general coverage receiver to check DDS chip. All other parts of test worked out beautifully.
Did Groupd 2 assembly and modifications and on Group2 smoke testReceiver seemed to be wprking well. I got signals on 40M. Could not do DDS Freq. calibration and precise BFO adjustment. Entering Calibration Modes worked out okay.
Reference freq. calibration and IF offset adjust and BFO trimmer set could not be done as I don't have a scope.Could not figure out how to do BFO adjustment asa I could hear side tone but no BFO beat note.
Pretests:
Before installing L7 I installed U8 and put the rig in straight key mode.Measured the voltage on pins 1 and 13 and everything is okay there.I keyed the transmitter and measured the voltage on L7 pad and get no reading. I checked the values of R34 and R35 and they're okay. I don't know how to check a transistor as I've never done that before. Might Q5 be shot and if so, where can I get one? I went over the solder points for cold solder, but I still get no reading out of L7 pad.
Thank you,
Ren

After searching Q5 on the groups messages, I came across a post with somewhat the same problem. I keyed the rig in straight key mode and measured the voltage on pins 1 and 13 of the IC and got a .67 volts reading, still nothing on the L7 pad.

From: Ren
Topic: 2026 Message: 2028

Though I've never done this before, I tried to check the transistor. Please bear with me as this is a first for me.

With the key open:
Source read 0 volts
Gain read 0 volts
Drain read 10.19 volts

With the key closed (as if I' were sending a signal):
Source read 0 volts
Gain read 4.84 Volts
Drain read 0 volts

Hope this information helps.

First, you might have more luck telling us the voltages on Q6, which is keyed to supply the voltage to L7. (is it possible your not putting the volt meter on the correct pad?).

With the phone and paddle jacks facing towards you (as the board would be used in the cabinet), the source of Q6 is the lead on the left and should have the DC supply voltage on it of about 12V. The center lead is the drain, which connects over to L7. The lead on the right is the gate and with key up will also be at the DC supply voltage.

Now put the rig into straight key mode, so you can key Q6 on and off. (turn board on with dash paddle input grounded)

Close Dot paddle input. The gate voltage should drop to about 3.8 volts, assuming 12.0 volt DC supply. Drain should to to DC supply voltage. If so, everything is working okay.

If the gate does not pull down to about 3.8V when you key, the problem could be with R35 or Q5. Make sure the value of R35 is 47K and not something higher, like 470K, a similer value also used, but in the receiver audio amp section.

If the gate is pulling down the about 3.8 volts, but there is still no voltage on the Drain of Q6, then Q6 might have been damaged and needs to be replaced.

BFO adjustment: Put the board into calibration mode and then click the function (menu) button once. With the volume control turned all the way down, you should hear just the side tone. Now turn up the volume control and you will hear another tone, which is the BFO beat note. If you turn the volume control so that the BFO beat note is about the same volume as the side tone, you can hear a third tone, the mixing of the side tone and BFO note. If they are close in frequency, it will be a slight wabbly sound. If your ears can't detect this wabble, simply adjust the BFO note for loudest volume, which will peak it in the pass band of the audio filter.

recheck everything from step 1 make sure the chips are plugged properly into their sockets "pins can be bent over during insertion"
and as steve says make sure all the component values are correct.
hendriks sometimes makes his own component substitutions.
what i do is check each resistor with a n autoranging digital multimeter before insertion. sometimes the color bands on 1/4" watt resistors arent easily read without a magnifiication.

From: Steve Smith
Topic: 2026 Message: 2033

Ren,

Those readings are nominal.

You will not get any reading at L7 pad(s) until Group 3 is finished (at least the installation of Q6 and surrounding components).

BTW, it is Gate, not Gain.

After Q6 and its ancillary components are installed, measure the voltages on Q6. They should be approximately:

Unkeyed

D = 0V
G = 12V
S = 12V

Keyed

D = 12V
G = 2.5V
S = 12V

If everything is OK you will also have 12V on L7 pad (or pads if L7 is installed).

73.......Steve Smith WB6TNL

2034. Group 2- Complete?

Yahoo group: pfr3_group
Date: 2011-02-24 01:26:58 UTC
From: briznead
Topic: 2034 Message: 2034

Hey guys,
This is such a cool little kit! I recently finished group 2 and what a joy it was to receive signals...

Much like Ren, I dont own any testing equipment like a "scope" or a freq. counter...Im hoping I did the calibration right so here is what I did:

WWV beat: hooked up a short piece of wire to TP1 and fired up MultiPSK...In Cal-r the tone was somewhat close to the tone WWV displayed on the waterfall but I went ahead and centered it dead on anyway....

I then hit "menu" to move onto the BFO adjustment. The instructions said to hit "keyer" to store what I set but would just pressing "menu" do the same...?

BFO adj: Plugged in headphones and adjusted volume to match the tone per instructions....Tuned the cap slowly and heard the wa wa wa and kept adjusting until the wa wa wa went steady and matched the tone generated by the PFR....Sound right?

Once again I hit "menu" hoping everything was stored....The instructions kind of had me puzzled on how to store what I did, that's why I am curious if I did it correctly...

Thanks guys! Moving onto Group 3 now...

Dave

Thanks Dale,
Figured I would run into a problem sooner or later....On Group 3 and doing the pretests before installing L7 (pg 11 toward the bottom)....

Measured the voltage of L7 and it read 7.63v....Im using a 9v battery right now....Measured the voltage of U8 pin1 and that read 2.36v...Manual said it should be about 2.5v....Measured voltage on pin13 and got nothing...Tried to measure both sides of pin13 and still nothing...

Dale, do you or anyone else out their have any ideas...?

Thanks again, guys!

2037. Rotary encoder kits - 10pcs available

Yahoo group: pfr3_group
Date: 2011-02-24 23:11:51 UTC
From: Petr
Topic: 2037 Message: 2037

Hello,

as Miroslav already shipped all of the encoder kits but his wish list is not cleaned still he decided to complete another 10pcs of kits using his "spare" PCBs and rest of ICs / encoders. So last 10pcs is available at this moment for those who do not made decission yet.

Some of You asked me if Miroslav is thinking about another batch of kits. In my oppinion it depends to number of orders in his list. It is not possible to keep the current kit price if ordering of PCBs and ICs + encoders etc. will be just for 5-10 people. If another new owners of PFR3 or ATS4 will interesting in these kits and Miroslav will have 20-30 orders again then it should be ok to arrange another batch.

So if You are thinking about then do not hesitate to contact Miroslav to let him know how many of You are still want this kit.

best regards,
73 - Petr, OK1RP

2038. Anyone got a bullet??? For me not the radio....

Yahoo group: pfr3_group
Date: 2011-02-25 19:48:38 UTC
From: N. A. Monllor
Topic: 2026 Message: 2038

Hi Steve,

Let me start by saying I wish I knew what you forgot about electronics, so I send my apologies for my ignorance in these matters. I "am" trying to learn as quickly as I can, but it's one hell of a learning curve. Thank you for whatever patience you can show me.

The problem I was having was with the fact that I still had not continued populating the board. Once populated, I followed your suggestions and all measurements were within the ballpark and within tolerance. Thank you very much.

Went to my Elmer's house because I noticed that on receive the signal was very strong when S7 switch was set to tune, but when switched to Operate I'd lose most audio. He suggested I put it all in the case and button it up, so I did.

This morning I went to put it on the air. I hooked it up to my G5RV and in "Tune" I couldn't get the LED to dim in the slightest or go out. So I took the board out of the case (major PITA), hooked it up to a power supply and noticed that if I keyed the transmitter into a 50 ohm dummy load the light would dim some, but not go out. Re-hooked it up to the G5RV and the light was as bright as ever. I need to mention that since there was only one 470 ohm resistor included in the components package and it was used at R3, I did a search on R48 and saw that 1K ohm was suggested over the 470 ohm, so I made the switch.

While I had the radio hooked up to the Hendricks Dummy Load, I thought I'd check my power out on transmit and I measured my voltage at about 9 volts with key down, equating to about 1 watt out @ 12 volts through a power supply (Bummer). My VOM has a 10M ohm impedance and not the suggested 11M's.

Well, I think I burned out the LED because it is not lighting at all.

Could I use any LED or should I order it from Hendricks?

How would I troubleshoot the Tuner portion?

What should I do about the 1 watt output to get it up to the 5 watts out?

There's a part of me that just wants to send the radio to you with a check, but there's a bigger part of me which wants help in figuring out how these marvelous little radios work.

I'd like to have this puppy up and running by the 21st of March as my local club is having a QRP centered picnic and QRP is kind of "laughed at" in the club. I've also seen NG9d's little yellow radio and its capabilities, HA! I

wouldn't laugh at what a person could do with QRP.

Thank you Steve,

Ren

Topic: 2026 Message: 2039

First, you can not burn out the LED. (unles you put a 12 volt supply directly across it)

Second, using the BLT tuner takes a lot of practice. The tuning is very sharp and it is easy to miss seeing the LED dim. To complicate the problem, the two controls are very interactive. You often have to de-tune one and retune the other, working back and forth to get the light to go out. You also must have the correct impedance setting.

To get the settings in the ball park, first adjust for best signal strength on the reciever. Then make your adustments VERY SLOWLY.

G5RV's can be hard to match to and the BLT might not have the range needed to do so. What kind of G5RV do you have? Is it the long 105 foot one or the short 44 foot one and is it feed with ladder line from the rig or changes to coax? The G5RV was designed to be a 20 meter antenna, but will work on 40, though I've found I've had to fuss with the lenght of coax to make a match on 40.

The receiver signal should not go up in tune mode, it should go down. If it is going up, then there is something not wired right or shorted out or what you think is tune is really operate.

When measuring power, make sure your settings are correct. The tuner and SWR bridge needs to be bypassed. If this is the case and your still getting low power, then you don't have the correct number of turns on the toroids or don't have the wire spaced properly. The turns should be more or less evenly spaced around the core to start with.

Steve

What I've done in the past is, I Dremeled a notch in one of the plastic tips of my solder suckering tool, big enough to fit the soldering tip into and used the tip to melt the solder; then hit the little button on the side of the sucker. It took a couple of tries, but I was able to get the solder out that way. Be patient with it.

What's funny is, I thought crap like this only happened to me!!

Hope this helps.

2045. Re: Anyone got a bullet??? For me not the radio....

Yahoo group: pfr3_group
Date: 2011-02-26 21:43:28 UTC
From: Ren
Topic: 2026 Message: 2045

I've got the long G5RV antenna with ladderline and a balun, it then changes to coax. From the end of the antenna (where the balun changes to coax) I've got about 35 feet of coax coiled on the ground and from there another five feet to the radio inside the house.
I took the board out of the case this morning and rechecked the connections for cold solder joints. I also adjusted the L8, L10, L12 windings. I found I had forgotten to solder 2 pins on the S7 switch so now it is louder on Operate than on Tune. I took another power out reading and it seems to have improved to 5 watts out. Happy times!!!
I checked the tuner out but still couldn't get the light to dim, so I pulled out and assembled the home-made Pac-12 I use with my RockMite and BLT+ tuner and hooked it up to the radio (without the BLT+ of course) but to no avail. I still can't get the light to go out. I literally crawled the adjustment on the Load and Tune knobs from one end of their travel to the other and still no luck.
As I tired of pounding salt, I hooked the rig up to my dipole again and ra it through my MFJ Versa Tuner 2, and the light was dimmed by about half. I made a small adjustment on the Versa Tuner and the light went out completely. My question at this point is, could it be the capacitors or could it be the resistor I switched (from the 470 to the 1k)?

Thank you,
Ren

>
> First, you can not burn out the LED. (unles you put a 12 volt supply directly across it)
>
> Second, using the BLT tuner takes a lot of practice. The tuning is very sharp and it is easy to miss seeing the LED dim. To complicate the problem, the two controls are very interactive. You often have to de-tune one and retune the other, working back and forth to get the light to go out. You also must have the correct impedance setting.
>
> To get the settings in the ball park, first adjust for best signal strength on the reciever. Then make your adustments VERY SLOWLY.
>
> G5RV's can be hard to match to and the BLT might not have the range needed to do so. What kind of G5RV do you have? Is it the long 105 foot one or the short 44 foot one and is it feed with ladder line from the rig or changes to coax? The G5RV was designed to be a 20 meter antenna, but will work on 40, though I've found I've had to fuss with the lenght of coax to make a match on 40.
>
> The receiver signal should not go up in tune mode, it should go down. If it is going up, then there is something not wired right or shorted out or what you think is tune is really operate.
>
> When measuring power, make sure your settings are correct. The tuner and SWR bridge needs to be bypassed. If this is the case and your still getting low power, then you don't have the correct number of turns on the toroids or don't have the wire spaced properly. The

turns should be more or less evenly spaced around the core to start with.

> Went to my Elmer's house because I noticed that on receive the signal was very strong when S7 switch was set to tune, but when switched to Operate I'd lose most audio. He suggested I put it all in the case and button it up, so I did.
>
>
>
> This morning I went to put it on the air. I hooked it up to my G5RV and in "Tune" I couldn't get the LED to dim in the slightest or go out. So I took the board out of the case (major PITA), hooked it up to a power supply and noticed that if I keyed the transmitter into a 50 ohm dummy load the light would dim some, but not go out. Re-hooked it up to the G5RV and the light was as bright as ever. I need to mention that since there was only one 470 ohm resistor included in the components package and it was used at R3, I did a search on R48 and saw that 1K ohm was suggested over the 470 ohm, so I made the switch.
>
>
>
> While I had the radio hooked up to the Hendricks Dummy Load, I thought I'd check my power out on transmit and I measured my voltage at about 9 volts with key down, equating to about 1 watt out @ 12 volts through a power supply (Bummer). My VOM has a 10M ohm impedance and not the suggested 11M's.

2049. Hendricks dummy load and PFR-3

Yahoo group: pfr3_group
Date: 2011-02-27 00:50:54 UTC
From: William MacCracken
Topic: 2049 Message: 2049

I would like to measure the power output of my PFR-3 with my Hendricks dummy load. The dummy load manual says, "A digital voltmeter with an 11 Megohm input resistance is needed to make the measurments." I have 2 multimeters. There's no relevant information in the manual for the really cheap one. For the not as cheap one, the specifications list an input impedance of 7.8 MOhm.

Can someone tell me if either or neither of these meters can be used to determine power output in watts using the chart in the dummy load manual? Also, why since the measurement made is DC voltage does the meter used need a 11 Megohm input resistance?

The load on the detector diode detector to some extent influences the voltage drop across the diode. At very low power levels, this voltage drop will infulence the apparent power you measure.

However, in practice, the change in voltage drop between say a 11 meg load and even a 1 meg load will be pretty much insignificant compared to the natrual variation in voltage drop from device to device, so I wouldn't worry about it.

Figure what ever power you measure, it will only be accurate to about +/- 10%

Hi Tom,

There is no need to destroy the switch and then have to wait for one to be shipped by QRP Kits.

Try Solder Wick first. You should be able to wick out almost all of the solder. Then carefully twist the switch pins to break whatever solder connection remains. DONT use a lot of twisting. If the solder connection doesn't break with only gentle twisting, STOP and try something else.

OR

Using an iron with a big tip, blob up a lot of solder around the switch pins. Heat all of the blobs of solder and keep them melted while gently pulling on the switch. Again, if it doesn't come out easily, STOP. The iron doesn't need to be high powered (40W will be fine) as long as it has a BIG tip to hold the heat.

Best of luck with the repair.

With a lot of patience, and a source for hot air, like an embossing tool, and a lot of patience, one could slowly heat
the board directly over that switch, and very carefully, and slowly, with a lot of patience, remove the switch, then with
all that pent up alacrity, speedily move the switch to the other side of the board, and reinsert it. Of course when the switch comes out.. the hot air is removed. The switch can then be resoldered into place.. and if it doesn't fit into the board very well, that would be a really good time to apply or use the desoldering technique available.
Good Luck,

Actually, the best way to remove a part like this is with a good quality solder sucker and an iron which can throughly heat up the pins and solder. But if your lacking the proper tools, you are best off the break apart the switch and remove each pin individually from the board. That is about the only way to ensure you don't damage the plate through holes.

Is your RF Wattmeter accurate at QRP levels?

Are you operating the rig in the "Coax" switch position or "BLT"?

Did you inadvertently leave the 'Tune-Operate' switch in "Tune"?

What is your power source (voltage and type)? Have you made certain it's not 'sagging' under the load of the transmitter?

What is the current drawn (in mA) by the rig in transmit? (continuous carrier)

Steve,
I should have clarified what Im doing...
Operating in "Coax" position....Running on battery supply (8 brand new AA's)...Also in "Oper" position...

BNC on the back is attached to coax that runs to my tuner but that has outputs for my 40m dipole and my 20-10m beam....The tuner is set to "bypass" so it is a direct route....

40m= 1w
20m= 1w

I dont have anything that operates on 30m at the moment...

Will try to trouble shoot more in the morning...

From: briznead
Topic: 2056 Message: 2061

Well, I got to thinking...Only 1w on all bands doesnt sound like a winding issue...S7 is a 3 position switch...When I had the switch all the way to the right (for operate) nothing happened...Looking deeper into the manual, it had mentioned that the left two postion on the switch are the same...So, I took a look at the board and their it was...

I had forgot to solder the 2 pins on S7 for the switch to work in the "operate" mode....After soldering, it now puts out the following:

40m= 4w
30m= 4w
20m= 5w

So, I am a happy camper..!

Thanks for the help, guys

Way to go Dave!!

--... ...-- Dale - WC7S in Wy

To: pfr3_group@yahoogroups.com
From: briznead@...
Date: Mon, 28 Feb 2011 16:15:07 +0000
Subject: [pfr3_group] Success!!

Well, I got to thinking...Only 1w on all bands doesnt sound like a winding issue...S7 is a 3 position switch...When I had the switch all the way to the right (for operate) nothing happened...Looking deeper into the manual, it had mentioned that the left two postion on the switch are the same...So, I took a look at the board and their it was...

I had forgot to solder the 2 pins on S7 for the switch to work in the "operate" mode....After soldering, it now puts out the following:

40m= 4w
30m= 4w
20m= 5w

So, I am a happy camper..!

Thanks for the help, guys

Thanks again, guys...!

Just had a QSO with KG6MU in Palm Coast, FL on 20m...My RST was 569...Not too shabby with only 5 watts from Houston, TX..Such a joy to get an answer after sending out that first CQ on this rig...Ive never operated QRP before...Im hooked, now!!

Now it's time to put the decals on and the rest of the knobs...

One thing I noticed, the external power receptacle doesnt fit the hole on the case...Seems like it is blocked by the threads...

From: Carey Magee (K2RNY)
Topic: 2056 Message: 2066

Hi Dave:

I came across this exact issue. I was able to widen the hole with my drill press. Caution is the word here. Go slow no matter what method you use.

PFR-3A is a great rig. I also get 4,4 and 5 watts out on mine. Hope to work you in the future.

73,
Carey

That's great news Dave!

The problem with the power connector fit is likely interference from paint buildup on the inside of the hole.

Some of the cases have just a touch extra paint in the holes, a quick brushing with the round file.. will make it all better..
And if you have a tap and die set, running the threads clean on the case screws makes those work lots better too.
Congratulations,
Qrp rocks!!

Will give that shot soon....Thanks Dale....

Went and bought some 18 gauge insulated wire and cut 34ft of it and installed a bannana plug on one end and a fishing weight on the other and tossed it up in the tree....Counterpoise was about 15ft of wire thrown on the floor....

The BLT works GREAT! I thought it was going to take a lot of work to get a match but it really went pretty smooth...Made a contact to Tuscon, AZ on 20m....Switched over to 30meters and lots of DX activity going on...Tried and tried to get through to SB9CVQ but couldnt bust through....Started getting cool outside so packed it up and headed in....

This little box is so much fun!

2072. SCAF filter

Yahoo group: pfr3_group
Date: 2011-03-01 04:55:53 UTC
From: MAXXOUT2@AOL.COM
Topic: 2072 Message: 2072

I no longer need this unit.
It works very well and if you live in a high QRM area this will let you null out most of the QRM.
At 1 time I was very impressed and recorded how much better this worked on my FT 817-D with a CW filter.
I phoned in the recording to Idiom press.
The unit is the Idiom Press SCAF filter
You can read about it on Eham
http://www.eham.net/reviews/detail/3075
(http://www.eham.net/reviews/detail/3075)
No cables or paper work since I always operate all my gear from 12 volt batteries.
This SCAF filter is a must especially for CW OP's
Also this is factory built.
$60.00 Shipped to your door.
Contact me off list.
No pay pal so a Postal money order will work fine
BOB
AF2Q

http://idiompress.com/scaf-1.php

ive had one that i purchased as a kit an assembled
the kit is well made and works well.
our pfr3s have a very tight filter + a simple audio filter.
on something like the drake tr4 that i had used it on the scaf works very well
i also used it on my tr7.
the pfr3 has very sharp filtering.
its a mixed blessing when band crusing.
my kenwood 950sd has a scaf filter on the secondary reciver.
$60 is a good price for an assembled unit with shipping thrown in and its a factory built unit too
"$135 from idion" my construction workmanship is fairly good
i have purchased kits that wernt very well constructed .

I no longer need this unit.
It works very well and if you live in a high QRM area this will let you null out most of the QRM.
At 1 time I was very impressed and recorded how much better this worked on my FT 817-D with a CW filter.
I phoned in the recording to Idiom press.
The unit is the Idiom Press SCAF filter
You can read about it on Eham
http://www.eham.net/reviews/detail/3075
No cables or paper work since I always operate all my gear from 12 volt batteries.
This SCAF filter is a must especially for CW OP's
Also this is factory built.
$60.00 Shipped to your door.
Contact me off list.
No pay pal so a Postal money order will work fine

Hi Dick,
I've used some of hte "larger" wall warts... that are regulated and are clean, not noisy or have a high hum, that most of the smaller ones do... however, to me.. the most fun is with a small solar charger, and batteries. Otherwise, I also use the station's 12V rail. That is a large dc regulated supply feeding a distribution system for all of the 12v stuff that needs power at different times.
And.. once in a while... I'll use a 9v battery, especially one that is deemed to be "dead"... and aimed at the trash can,...
then I take it.. and use it to talk to...?? And sometimes.. if it is an "ornery" day....
I'll report back that the "dead" battery talked all the way to..... :0)

Dick,

I just usually use a 12V gel cell both in the shack and when out in the field. It is easy to charge, lasts a very long time at 5 watts and is very "clean."

Either the main 12v on the bench, or my solar charged batteries.
I also have a bunch of 12V-7AH sealed batteries that I get from an alarm system tech. They changeout several a week as part of PMing the systems. They're about 2.5 x 3.5 x 6 inches and have 1/4 faston terminals. I charge those off the solar system. I know it's not the best way, but they didn't cost me a lot.

GE Ren - My solar/battery system is a fixed one, on the roof of the radio shed. It isn't a portable system. The link that W2LJ posted is a good start. There are a few QRPers out there that have done a lot of building and operating different panel/controller/battery systems. Try searching "solar portable qrp" lotsa hits.

From: wb9dlc
Topic: 2077 Message: 2086

Dick

The key is, don't use a poorly regulated 12v wal-wart that puts out more than 12v.

I found some high end AC Supplies at a ham fast - Sony MPA-AC1. I've been using it since day one.

I see that you can buy them online (Google sony mpa ac1) :

http://www.usadapter.com/LCD-AC-Adapters/4708.html?gclid=CIjyn7TWsqcCFYjsKgodLxrBBQ

You just need to put the correct connector on it.

2088. PFR-3 power

Yahoo group: pfr3_group
Date: 2011-03-04 22:33:03 UTC
From: peter mudgett
Topic: 2088 Message: 2088

At the home shack, I use the 12V gel-cell option with the UPS APC-200 doing double duty for my computer and PFR-3A at the same time. I added the 2 silicon rectifier diodes (and fuse) in series as suggested in the PFR-3A manual. Sometimes I run it from a 9.6v power tool NiCad battery and sometimes from 9 AA NiMH batteries usually in the field. Have also used my car cigarette lighter socket when camping. I always keep 8 AA alkaline batteries in the internal compartment, but because of the expense, I only use those for receiving when other power sources are not convenient.

Good luck and lots o fun,
Peter - KB1PBA

2089. First real QSO ever, and man did I blow it.....

Congratulations Ren, sounds to me like you did a fine job of it.
The nerves get easier to handle, they really do. It took me a quite a while to get past the shaking.. but it does happen.
The lack of sleep tho, may become a bit of a problem... shortly after the first Q, the second one follows, and shortly after that one,
the next, then the next, then well, pretty soon, the sun comes up...
As far as what you copied to what's in QRZ... he may have been on a trip, or maybe QRZ isn't up to date...I'd send a card anyway. If you copied a mailing address.. I'd use it. If now use QRZ.
Then.. before very long.. I'd get back on.. and see if the nerves are as bad the second time?
When might that be?
Maybe someone would be waiting for you?
Have a great day, full of fond memories that will always be dear,

Hi, Ren, thanks for the update. Glad to hear you got your kit completed and on the air successfully. Congratulations on your first! Yes, the first is always a bit shaky. You didn't say what band your QSO was on.

I would drop him an email (you can get it off QRZ) to confirm your info. He may have moved or been operating portable.

Best of luck with the new rig, and I'll be listening for you.

Terry

Thank you Steve,

Thank you for having designed such an incredible little radio and for your help with my build, I really appreciate it truly. I'd also like to thank Dale in Wy. for having checked it out to make sure I didn't screw it up too badly and make the final adjustments.

All I can say is that I love this little yellow box so much that I had my daughter make a cover for my Kenwood TS-530 and it now sits respectfully in repose, on its space on the shelf. Bravo to you Steve.

As far as the call sign goes, I really think I got it down correctly, as he sent it many times and they just so happen to be letters I know real well. I did have my doubts though, so I inserted pretty much the entire alphabet into QRZ, where I might have made a mistake and still came up with "somewhere in the United States". That's not to say though that you're not correct in the possibility of miscopy.

Thank you all for the kind words of encouragement,

Ren

CONGRATS KG4BAS--REN!
WAY TO JUMP IN THERE & GET THAT FIRST QSO!

ONE THING I ALWAYS TRY TO TEACH MY HAM STUDENTS IS: THE BASIC QSO
FOR ANY CREDIT OR CONFIRMATION REQUIRES THE CORRECT CALL, BOTH WAYS,
AND THE CORRECT RST REPORT BOTH WAYS, PERIOD !
ALL THE OTHER STUFF IS PART OF THE RAG CHEW, NAME, QTH, WX, RIG, ECT.
IF YOU MISS ANY OF THAT INFO, QRZ IS A WONDERFUL RESOURCE FOR IT.
PEOPLE DO MOVE ABOUT A LOT, AND USE DIFFERENT NAMES, SO BE PREPARED TO COPY DIFFERENT INFO.
TRY TO KEEP THAT INFO SIMPLE & TO THE POINT.

You're very welcome Ren,
Happy to help,
One thought... if he sent his call.. repetitively, over and over... is it possible, that the number may be off by one ?
I have to send my call, over and over, when folks try to put me in California.. or 5 land....
just a thought.
Good Luck and Have a great time with it... Steve makes it a real kick to operate,

Subject: RE: [pfr3_group] First real QSO ever, and man did I blow it.....

Thank you Steve,
Thank you for having designed such an incredible little radio and for your help with my build, I really appreciate it truly. I'd also like to thank Dale in Wy. for having checked it out to make sure I didn't screw it up too badly and make the final adjustments.
All I can say is that I love this little yellow box so much that I had my daughter make a cover for my Kenwood TS-530 and it now sits respectfully in repose, on its space on the shelf. Bravo to you Steve.
As far as the call sign goes, I really think I got it down correctly, as he sent it many times and they just so happen to be letters I know real well. I did have my doubts though, so I inserted pretty much the entire alphabet into QRZ, where I might have made a mistake and still came up with "somewhere in the United States". That's not to say though that you're not correct in the possibility of miscopy.
Thank you all for the kind words of encouragement,
Ren

So long as you got the call correct, that's all that really matters. But
since the name and address don't seem to match, maybe the call isn't
correct? Hate to bring that up as a possability.

But anyway, congrats on the first QSO and many more to follow.

2101. The ERRATA is making me crazy!!!

Yahoo group: pfr3_group
Date: 2011-03-10 01:31:11 UTC
From: k2ytj
Topic: 2101 Message: 2101

Just received my PFR-3 kit today and am anxious to get building; however, the Errata published on Dougs website page for the PFR-3 has me confused..., well at least the first two items do:

[1] "* There are two caps marked C48 on board with different values. One is between the phone and paddle jack and the other is just below U9. Note that the cap between the phone and paddle jack should be C30 (.01 uFD)"

[2] "* The color coding in the instructions for R6 and R7 are incorrect and should be orange orange yellow instead of red red orange."

After checking the manual, the board, and the parts in the parts bag, I came to the following conclusions:

[1] The cap between the phone and paddle jacks is actually C49 on the board and should be designated C49, not C30, which is actually 100 uF, not 0.01 uF. Can I assume that the manual, which lists C48 as type 104 and C49 as type 102 is correct?

[2] R6 and R7 are actually shown as 470K (Yellow Violet Yellow) in the manual, not "red red orange" (22K). Both 470K (Yel/Vio/Yel) and 22K (Red/Red/Orn) are in the parts kit, 330K (Orn/Orn/Yel) are not. Which to use?

Also, a number of resistors in the parts list are missing in the parts kit?

What is your experience and your advice?

It would seem simpler just to get the missing resistors out of my parts bin than pester Doug for them.

Resistors is a far as I've gotten, LOL... I am having fun.

Don't use the errata. Even it has mistakes.

What manual are you using?

Use the latest manual (says "updated 3/1/10" on the cover sheet). It shows 470K in two places for R6 & R7.

Best of luck with your kit!

IMO, the safest way is a light solution of dish detergent and warm water followed by clear water rinse, dry. Use rubber gloves to handle the dried housing.

I've had good experience with everclear, or alcohol, let it air dry, then handle the inside of the panel, apply the decals, then
after they dry, apply two coats of Clearcoat. Each time the panel is moved handling from the inside.
Good Luck, and Have a great day,

Yes, they are straightforward, and informative. There are a number of experienced builders here to help, and one more thing,
IF after you get the kit, and you look at the instructions.. and decide you don't want to wind the toroids. I can do that for you,
no problem.
Good radio for mountain topping. It won't likely get left behind, for not seein it.

I see that the New England QRP club just had a successful kitting party for their GREAT NEScaf audio filter. The filter also gives a good bit of audio gain and makes an ideal and efficient audio amp for the PFR, in addtion to giving more selectvity when needed.

I built mine in a small project box from Mouser and it gives of plenty of audio when plugged into the headphone jack of the PFR. Their www page says they are sold out (http://newenglandqrp.org/) but since their kitting party was for "future orders" it will be offered again... keep an eye peeled because they go FAST. It is an easy and fun build and is a great addition to the PFR (and/or any other rig)

2124. Re: [pfr3_group] PFR KIT

Yahoo group: pfr3_group
Date: 2011-03-17 01:20:06 UTC
From: Steve Smith
Topic: 2119 Message: 2124

Hi Bob,

It is mostly through-hole parts and what SMT parts there are come pre-mounted to the board. If you've built any other kit with through-hole and toroids you should be able to handle this one. If not, there are guys out there who will assemble it for you.

How did you come up with 10 builders? We don't hear from the builders who are not on this list and I'd bet there are plenty of builders who have successfully built the PFR and haven't said anything.

You can see a relatively close-up of the board here: http://qrpkits.com/pfr3.html
It will expand into something still quite viewable.

I sure like to get one of these kits but i'm not sure if I would have the skills to build it up.
Is this all SMT mounted parts?
All these small kits are the same just like the SW series but you have 10 hams building them and more then half have a problem they can't find.
Can someone mail me a large close up of the parts mounted on the board?
Thanks

Bob,

If you have built any Heathkits before you can do this one. I had assembled my SB-102, its power supply and the SB-200 linear. Also the HW-7 QRP kit, keyers, an FM radio and its amplifier. Also homebrewed quite a few QRP transmitters. I had studied the QRP radios out in ham radio land and met Steve who designed the PFR-3A among his other kits at Dayton last year. He answered my questions with quite specific answers and I was duly impressed. I am 62 years old, my eyes are weak and my hands shake a bit. My only problem was that I had to use a magnifying hood to read the color codes on the resistors and the very tiny numbers on the caps. No SMT parts to solder.

Just get a good small tip and temperature adjustable soldering iron and a magnifying hood (Harbor Freight is cheap). And go for it. You might find the torroids a challenge because of their small size, but they are doable. Trust me. The PFR-3A is worth every penney and then some. I will probably sell my FT-817 because I much prefer the PFR-3A. For one thing it is much easier on batteries and the antenna tuner is self contained and will tune about anything. I had so much fun building this little transceiver that I went on to build a 40M Softrock receiver with SMT parts and am about ready to start another SMT receiver project with even smaller SMT parts. Check out NG9D's videos on YouTube. Just can't get any better than his instructions. Have fun.

Raimund,

If your enclosure came pre-screened it is a PFR3. If you had to apply decals, it's a PFR3A.

Hello Raimund,

Yes, it appears that you have a PRF3A. Some of the PFR3 had software issues.

Has your radio done this since you finished constructing it or is this a problem that started now?

What have you done to troubleshoot this problem? Have you made any voltage measurements?

At this point I recommend removing U7 from its socket, check for any bent or folded-over pins the re-insert it into the socket.

Hopefully Steve Weber or someone with more experience than I have will check in here.

Hi Raimund,
The PFR3 had a couple issues with starting, fresh after a new build, most of those could be corrected with careful inspection of soldering, and as Steve said, reseating the chip. Is this a recently developing issue, or is this a new build?
Other questions also, include battery voltage, or internal or external supply.
Would be helpful to discribe your conditions, new/used, voltages, selector switches exercised or cleaned with deoxit, and such.
Have a great day,

yes - the rig done this since finishing.
powersupply is solid 12v external.
in state of "non-running" all voltage are at U7, no pins left or foldet - this small rig works after a while switching the right band-select from band-select. that's what confuse me.
I start me new investigation now with "resoldering" U7 and around. maybe this helps...

Hi Bill & all the group
let me resume what's all the buzz...

I checked all hints to keep rig working.
By finishing this rig it has this starting problems.
Band switch operates normaly. Let me describe powering up sequence:

1. I use external power 12V

2. Both Band-Switch set to 40m
3. power on
3.1 no display but audio
3.2 setting right band-switch to 30m
3.3 most of the times display starts working
4. rig can now operate on all bands without any problems

this sequence can be altered as followed (small chances)

2. Both Band-Switch set to 30m
3. power on
3.1 no display but audio
3.2 setting right band-switch to 20m
3.3 most of the times display starts working
4. rig can now operate on all bands without any problems

that's all.
any suggestions?

OK that is good information.

Please check the voltage on each position of S6 (left band switch) at the junction of R52 - R30.. It should be 2.5/1.6/0.22 V for 40/30/20. Also, the junction of S4 and R27 must be 5.0 volts with no buttons depressed. These must be very close to these voltages as that sets the A-D input voltages to U7. Anything out of range on either of these measurements may cause problems with U7 correctly initializing.

This should give us a clue as to what is causing the problem.

Hi James;
I checked those headphones out - they look great, but the cord is only 3 feet long, doesn't exactly give much room to get comfortable, so beware you may need an extension for a long session.
I am going to try them out, but I am going to get an extension to go with them.
3 feet seems pretty close quarters to me. Just FYI.

that is plenty long for me as the headphone jack on my "big rig" is on the front and i generally take the 'phones off when it is time to get up and stretch.

my only real complaint about most headphones is that the freq. response is too good and thumps and hiss are audible.

hoping to win a nescaf filter at OzarkCon next month!

Also looking for a passive filter plan that does not use the huge and hard to find 88mH phone toroids and will fit in an altoids box. I'm wondering if a single stage filter would be good enough to make listening more pleasant.

From: James
Topic: 2127 Message: 2142

that is plenty long for me as the headphone jack on my "big rig" is on the front and i generally take the 'phones off when it is time to get up and stretch.

my only real complaint about most headphones is that the freq. response is too good and thumps and hiss are audible.

hoping to win a nescaf filter at OzarkCon next month!

Also looking for a passive filter plan that does not use the huge and hard to find 88mH phone toroids and will fit in an altoids box. I'm wondering if a single stage filter would be good enough to make listening more pleasant.

Hi Steve
recalculating junktion
R52-R30 should result as 22k / 2k2 = 0.5Volts (you wrote 0.22v)
I start with S6b in 30m position.
ok for that - all voltages are present at this junction
40m - 2.48v
30m - 1.54v
20m - 0.45v
(this needs to switch S6b through the bands)

also
at the open end of R27 their is 4.97v present.

with this measure I took a look on the display - dark.
switching several times through the bands - no display
I turn to 30m for S6b. power off. 15seconds to wait. power on.
no display.switching to 20m display shows 20 and 060.0 - from this moment on I can run all other bands.

It drives me carzy... it's 10:10pm local and for me I am ill with strong coughing, some liquids behind my right eardrum. Have to take some amoxi 1000 for tonight - I'll leave for now returning tomorow.
thanks to you all folks for your kind assistance!
take care - Raimund.

Topic: 2139 Message: 2144

Actually, there is a very wide tollerance to the voltages.

40 meters: any voltage greater than 2.35 volts
30 meters: any voltage between 1.37 and 2.35 volts
20 meters: any voltage less than 1.37 volts.

Raimund's voltages are well with in these ranges.

The fact the display does not come on until the band switch is changed is a mystery. The display should come on regardless of anything else happening. The display not comming on implies either the reset pin is floating and being pulled low or the processor is not getting one of its supply voltages.

Raimnud - make sure pin 1 (reset) of the processor (MEGA48) is at 5 volts and not floating and that the two 5V supply pins are okay, along with the grounds.

Hi Raimund,

The manuals for the PFR3A show 1K for R30 which would make the voltage 0.22 V.

Yes, I can understand that this drives you crazy! Hope you are well soon.

Steve: It almost sounds like he has a PRF3 not an 'A'. Is it possible that he received a PFR3 parts kit with the new style housing or were early PFR3s shipped with 2.2K resistors for R30? He said that he got his kit in late 2009 but it has the decal housing.

Steve,

I re-read Raimund's emails and he says he got the kit in early 2009. Is that before the 3A was released? Maybe it's a PFR3 and he's got U7 problems or didn't make the board mod's, or both?

Thanks Steve, that jolted a memory, for me, I've seen this... same situation, maybe not the same cause.
But for me, it was the soldering around the display module, specifically the supply to the display was suspect.
So resoldering the entire display cured the problem.
And the 5v rails have an effect, that I've see too.

Actually you can put 2 on them in the same box.
BTW,
I see the title bar and I tried many different ear buds.
The best ones so far are the $19.99 Phillips and GET READY,
Radio shack AUVIO PEARL BUDS 96 dB and 16 ohms
A super close 2nd to the Phillips and on sale for $9.99 and then come with
3 different size foam ear pieces.

The differences are minor. Some mechanical changes were made to make assembly in some areas easier. The major difference was the addition of an audio AGC circuit instead of passive diode clipping of strong signals.

No, the PFR3 can not be ungraded to a PFR-3A and there really isn't any need to.

Yes, looking back he says he got the kit in early 09 and did not come with decals.

Raimund,

There is a cut and jump mod which needs to be done. Pin 7 of U6 (the mega48 processor) needs to be connected to pin 20, NOT to pin 21 as it is wired on the board.

This mod is made to the bottom of the board, so it does not need to be removed from the case. Cut the track between pins 7 and 21. Add a jumper to connect pin 7 to pin 20.

This should fix up the problem. I'm sorry this mod never made it into one of the manuals for the original PFR-3. I think there is a errata about it in the group files section.

Hi Steve
yup you got it right - according to the assembly manual it should be an early 09 edition (decal to install after assembly etc.).
problem is solved by doing the mod you can read within this thread below. (cut PCB U7 - pin7->>21 making a bridge pin7->>20 - as shown in schematic {which is right!})
so take care and thanks a lot for all your kind assistence.

Bob,

You have your station already - a digital camera and computer!

A university study in 2008 concluded there was over 400 years worth of video stored on YouTube! So don't worry about file size - they can handle it. And you don't even need an "FCC license" to broadcast yourself to entire planet Earth!

Of course none of us could ever live long enough to view even a small fraction of what is stored on YouTube, so we will need to know where to look for you, will your channel be "AF2Q"?

By the way, how is your PFR-3 doing?

Bob,

You have your station already - a digital camera and computer!

A university study in 2008 concluded there was over 400 years worth of video stored on YouTube! So don't worry about file size - they can handle it. And you don't even need an "FCC license" to broadcast yourself to entire planet Earth!

Of course none of us could ever live long enough to view even a small fraction of what is stored on YouTube, so we will need to know where to look for you, will your channel be "AF2Q"?

By the way, how is your PFR-3 doing?

I would lie to start doing U tube videos but lost on what I need.
I have a cam corder but 1 10 second hold on the button with the pictures set to the smallest size ends up being close to 80 megs
Some people told me that this would do what I want
Casio Exilim EXZ35 Digital Camera 12.1MP / 3X / LCD 2.5
Appreciate any suggestions

Thanks BOB
AF2Q

Many thanks to the guys who responded to me about the Utube phone.
I almost picked one up today and the price was good but I had to pay extra
for the memory card and some other item so I went for it but realized I
have to pay for that PFR-3 that will be here Wednesday then I can be official.
I have a button badge machine so I just may start banging out PFR3 pin
badges.
If it oes arrive on WED. I will be on 7.035 + - 5KC at 5 PM EST or 19:00
UTC
It took som time to download the video to watch the rig in action but it
was worth it
Sounds great

Seems to me that he needs practice,... maybe a few years in a traffic net with real traffic. I have that Vibroplex brass racer too...and I have mine set so it doesn't move, and you don't have to lose touch with the paddles to release it.
Works fine. His isn't set up the way mine is.

2165. Swr indicator

Yahoo group: pfr3_group
Date: 2011-03-21 01:15:24 UTC
From: W0JP
Topic: 2165 Message: 2165

Just built my PFR3 and testing components, so far everything seems fine except swr indicator. I have my radio going to external swr meter to a dummy load. Swr meter indicates 1:1 to 1 swr as expected. When I select tune on the PFR3 the LED lights up red. I have not mounted in the case yet. I have 52 ohm mini coax going to a bnc directly from mainboard connection for coax. Does anyone know if the SWR indicator is for the BLT tuner only and requires the case switch that feeds the coax connector through the blt tuner?

Thanks,
Dennis

Hi Lynn,
I used to listen to a pair of fellows that played chess over the air, finally got to meet one of them, he had a bug, and slapped it too.
The folks in the Maritime Marine for the most part seemed to slap too... shoot for that matter, so do I when I come in from working with the horses, or building fence. And I need the horses to behave, when I take the PFR3 with me, in one of the saddle bags, and ride through the national forest, stopping to rest, let Sassy get a drink and a bite of mountain grass, while I play radio. It's a fun time. I'd do it mobile horse.. but I haven't gotten a good ground system figured out, under the whip..... you see.

Yahoo group: pfr3_group
Date: 2011-03-21 03:04:02 UTC
From: Steve Smith
Topic: 2165 Message: 2169

Hi Dennis,

You are configured correctly. With the switch in the "Tune" position the SWR indicator is in line with the transmitter output.

Assuming that everything is OK with the SWR indicator transformer and the bridge resistors, the only thing I can think of is that your dummy load is somewhat less than 50 Ohms. Since the bridge resistors in the PFR are 51 Ohms, that might make the LED light. But I can't believe it's that critical.

Topic: 2165 Message: 2170

Hi Steve,
Thanks for the reply.
I have the Tayloe swr indicator from qrpkits which looks like the same circuit which works fine with both 100w dummy loads I use and did not fully light until I used a 100 ohm to simulate higher swr to test.
so if the same circuit , there appears to be some good tolerance if DL was off even 10 ohms.

I thought maybe using actual 50 ohm coax to test vs. Wire supplied with kit messing up some inductance or reactance compensated for on the board. Will mount in case in a few days and see what happens. Maybe stray RF getting in circuit without the case looking like reflected voltage.
Thanks,
Dennis

Hi Dennis,

Yeah, that's what I figured. It's good to have that information about the Tayloe circuit for future reference.

I doubt that the coax is causing your problem unless it's shorted or something. Have you checked to make sure that you have full rated power output with the switch in the Operate position and that it drops by about 1/2 when you move the switch from Operate to Tune. That might give you a clue as to what's going on.

hi to the group
the mystery is just discovered by following this link within the group:
http://groups.yahoo.com/group/pfr3_group/message/2154
it relay to an error on the PCB!!! where U7-p7 is etched to p21 instead p20 as shown in the schematic. after modding rig runs for worldcup. so be patient and check-out you PCB bottem-side. BUT first find pin 1 (use a marker), counting to pin 7...

tolerance to the voltages should be within a 10% range (according the resistors used....). voltage can be calculate because it results ratio the resistore devide the 5V supply.

thanks for the moment - take care

Thanks for all the info Steve. I found wires on the transformer got wrapped under each other under the core and were shorting out where they were tinned and basically connecting primary winding to secondary circuit. Untwisted and it works fine now.

Think I'll do some resistor value testing as 1.5:1 lights up quite bright. I would prefer max brightness around 2:1 as long as I get some lighting down low. I think it will be a more effective indicator. I did some testing at 2:1 and final seems fine.

I now run 1w in tune mode and 5w operate with 50 ohm dummy load.

Hi Dennis,

Glad to be able to help, even if in a small way.

Yes, the final should be fine at 2:1 with the SWR indicator in line because the bridge resistors absorb most of the power.

Yes, you could try increasing the value of R48 to reduce the sensitivity somewhat. Of course, that would make it harder to 'read' the LED outdoors in the bright sun.

2193. New Paddles for the PFR3A I made...

Yahoo group: pfr3_group
Date: 2011-03-24 22:16:21 UTC
From: Ren
Topic: 2193 Message: 2193

Hi guys,

I just uploaded a couple of pictures of the new paddles I made. They are in the KG4BAS album.

The base is 6061 Aircraft aluminum and the paddles themselves are of the BullDog type design.

My personal design criteria for these paddles were:

1. A much, much smaller footprint than presently available, with the paddles against the base, the difference is a mere 3/4" from the bare radio.

2. A unit that could be either a permanent fixture to the radio case or taken off, if I wanted to use one of my straight keys.

3. Weight. They weigh in at a mere 1 ounce.

All in all, a successfull homebrew.

I contacted Louis Petkus of BullDog keys, as I didn't want to infringe on his idea without permission and he said that if there was enough interest, he would like to offer these paddles on his website.
Any feedback, as always, is appreciated.

Be well,
Ren

2194. Returning pfr3 rig

Yahoo group: pfr3_group
Date: 2011-03-25 19:38:39 UTC
From: pileupjunkie
Topic: 2194 Message: 2194

Dale was nice enough to let me try this rig out.
I boxed it up once but hated to return it so the next day I did some more test.
Below are the things I found that may help others.
1.I turn rig on then hit tune button.No power on 40 or 30 meters but 5 watts on 20 meters.
I tapped tune button again and when I saw the display I started sending into the dummy load and I had just about 5 watts on all 3 bands
So I used an end fed wire to try making a QSO.
Tuning is to sharp to be of any use because I would spend most of my time trying to get that light out.
I did get it out on 40 meters and almost out on 20 meters but the tuner had no affect on 30 meters.
So I tried again to get a contact and the rig just went dead,
Everything off with the switch on.
I had to shut down and wait 30-45 seconds before I could power up again.
Another thing I noticed is that some times I was sending then my power dropped down to 3 watts then go back to 5.
I did down load the manual and I tuned for max RX then peaked the receiver
I did an A/B test for audio against the HB1A China rig.
The China rig audio was very much louder when tuned with a simple end fed tuner.
From what I know about electronics I think most of the problem with the prf3 is the tuner.
SWR goes up,draws to much current so the rig shuts down.
Also when I finish sending my call I went back to tune and all bands had 5 watts
It only shows power on 20 meters on the first turn on,then tap tune then check the power.
I hated to pack it back up again but it does have a problem.
Maybe Steve will read this and can figure out what the bug is,shut down,power only on 1 band in tune position then changes back to full power on all bands when I tap the tune button and start sending.
That 5 watts on all 3 bands put a big grin on my face but then when I started sending power dropped then the rig shut down.

Bob,

This sounds to me like a bad solder connection, probably at one of the torroids. Once the problem is fixed, you will find that the tuner works very well when you catch on to the technique. It will tune almost anything.

With the PFR-3 I used the old-fashioned method of just scraping the enamel from the wire with my pen knife. That worked great.No solder problems. A couple of weeks ago I built a Softrock 40 receiver and thought I would get fancy and sand the enamel from the wire. That did not work well at all. I had to take the wound torroid back out, rewind it, scrape the wires with my knife then solder it back in. That worked. Frustrating isn't it?

Hi Keith,
Well your thinking like I did.
However three different bugs but 2 point to the tuner.
I did not build the rig and it smells factory new.
Flawless paint.
It is just no power on TUNE when I first fire it up and I don't think that is a tuner problem.
However I have built up several ZM-2 tuners from Emtec but I was able to get some tuning room with them.
I don't want to open the rig because it is going back unless Steve reads this and maybe I can send it to him for needed repairs if he still does them.
I think the FEE is $35.00
Got to admit it has a hot RX and it is tight.
But I think it's more then a solder joint on a core that makes it shut down.

Yes, I did read that. But you got the rig from Dale and I'm sure it was working 100% when he shipped it. I don't know what you were powering it with, but it sounds like it was batteries which weren't in too good of shape.

Also there are two "tune" modes. One is the slide switch on the front panel which switches in the SWR bridge and reduces power out by 3/4. You also have to remember that switch has 3 positions, but with the center and left positions connected together.

The second "tune mode" is activated by the menu switch and allows using the paddle like a straight key. Which were you using or both?

Topic: 2194 Message: 2198

Steve,
I took my time and down loaded the manual and read that word by word.
I also know about the switches and the high and low Z settings.
Internal batteries are giving me 3 watts for a short time and 5 watts
hanging in with no problem,but it still shut down after sending CQ about 5 times
on 40 meters with the LD out
I used the tune mode to check for power as a straight key with a dummy load
What would cause the rig to show no power on 40,30 but full power on 20
meters?
The rig also tunes but the tuning is more like trying to split a hair..
I built several BLT tuners in the past and 3 that Etech sells.
They are sharp tuning but I do have tuning room about the width between the
2 tick marks.
I was thinking others would come in with input on the tuner but so far no
one has.
The tuner had zero effect on 30 meters and yes it was in the menu tune
mode.
It just stays half lit no matter where the tuner settings were.
I tune for max RX noise then go to the tune mode.
I start with the top knob since that is the one that is a little broader
then I peak the bottom.
20 Meters I can get the LED to almost nothing
I'm willing to send this to you and pay you to look at it.

Bob,

I'm pretty sure Steve still will correct any problems with the rig for that $35 fee. As an aside, I'm very thankful that purchased the original Hendricks paddle before they went out of production. It's a great design and perfect for the PFR-3. I wonder if the Elecraft paddle will fit the PFR-3 by some miracle? Might have to rework the connecting holes in the paddle to match the holes in the PFR-3.

Bob,

This sounds to me like a bad solder connection, probably at one of the torroids. Once the problem is fixed, you will find that the tuner works very well when you catch on to the technique. It will tune almost anything.

With the PFR-3 I used the old-fashioned method of just scraping the enamel from the wire with my pen knife. That worked great.No solder problems. A couple of weeks ago I built a Softrock 40 receiver and thought I would get fancy and sand the enamel from the wire. That did not work well at all. I had to take the wound torroid back out, rewind it, scrape the wires with my knife then solder it back in. That worked. Frustrating isn't it?

Steve,
I turn on the rig.
I tap the tune button.
Both switches are set for the band.
I try to tune 40 and 30 and have no power.
I then slide both switches back to 40,tap the tune button and now I have full 5 watts on all three bands.
It does this on the first start up
Several times while sending I noticed the power drop way down.
When it does this the power may go back up or the rig will just shut down.
Also does this with a dummy load hooked up.
When it shuts down I have to wait 30 to 45 seconds before I can power up again.
Enjoy your vacation.

Subject: Re: [pfr3_group] Returning pfr3 rig

The only reason I can think of you had power out on 20 but not on 30 or 40 is that you didn't have both band select switches set properly. The switch on to the right tells the processor which band to set the oscillator to, but the switch in line to the left connects the output of the filter to the antenna. Both switches have to be set to the same position for any power output to occur.

You might still hear signals on receive due to capacitive coupling between the toriods in the filter, but the signal strength would be way down.

There is nothing in the rig which will cause it to "shut down" other then low voltage, and then it would have to be very low, less then 5 volts.

If you were not getting any power out on 40 or 30, how were you getting power to adjust the BLT or call CQ on 40 with? Might all these be related to having the second band select switch in the 20 meter position all the time?

If you indeed had both band select switches set properly, not being able to match on 30 could well be the antenna. What type antenna/feed line are you using?

You could send the rig to me to check out, but you'd better wait 2 months, as I head out of town next Tuesday and will not be back until June.

Steve

I took my time and down loaded the manual and read that word by word.

I also know about the switches and the high and low Z settings.
Internal batteries are giving me 3 watts for a short time and 5 watts hanging in with no problem,but it still shut down after sending CQ about 5 times on 40 meters with the LD out
I used the tune mode to check for power as a straight key with a dummy load
What would cause the rig to show no power on 40,30 but full power on 20 meters?
The rig also tunes but the tuning is more like trying to split a hair..
I built several BLT tuners in the past and 3 that Etech sells.
They are sharp tuning but I do have tuning room about the width between the 2 tick marks.
I was thinking others would come in with input on the tuner but so far no one has.
The tuner had zero effect on 30 meters and yes it was in the menu tune mode.
It just stays half lit no matter where the tuner settings were.
I tune for max RX noise then go to the tune mode.
I start with the top knob since that is the one that is a little broader then I peak the bottom.
20 Meters I can get the LED to almost nothing
I'm willing to send this to you and pay you to look at it.

Yes, I did read that. But you got the rig from Dale and I'm sure it was working 100% when he shipped it. I don't know what you were powering it with, but it sounds like it was batteries which weren't in too good of shape.

Also there are two "tune" modes. One is the slide switch on the front panel
which switches in the SWR bridge and reduces power out by 3/4. You also have
to remember that switch has 3 positions, but with the center and left positions connected together.

The second "tune mode" is activated by the menu switch and allows using the
paddle like a straight key. Which were you using or both?

Bob,

I'm pretty sure Steve still will correct any problems with the rig for that $35 fee. As an aside, I'm very thankful that purchased the original Hendricks paddle before they went out of production. It's a great design and perfect for the PFR-3. I wonder if the Elecraft paddle will fit the PFR-3 by some miracle? Might have to rework the connecting holes in the paddle to match the holes in the PFR-3.

The so-called BLT in the PFR3 is not exactly the same as other Z-Match tuners, including the stand-alone BLT so it will not perform the same, especially as compared to the Emtech ZM-2 which has a wider adjustment range.

According to Doug Hendricks, "Steve, KD1JV, made some mods to the PFR-3 BLT specifically for a 44 foot" (doublet) "using about 50 feet of 450 Ohm window line. L1= 11t CT at 5/1/2, L2=6t. L3=2t, L2 and L3 centered around the CT."

IMO, it is -not- a wide-range tuner and wasn't designed to be. It certainly will not handle end-fed half-wave wires without some external 'help' to get the high impedance down to something manageable by the built-in tuner. Same goes with very low impedance loads. Be that as it may, it's a decent tuner able to be squeezed into a small box.

I've personally found all Z-Match tuners to have 'touchy' tuning and the one in the PFR3 to be not much different than the others.

So, depending upon exactly what you have connected to the terminals it may indeed have a narrow adjustment range or not be able to match it at all.

OK Steve,
I understand all that but remember the power dropping out?
OK I decided to remove the weak recharge batteries and I put in all new good quality SONY batteries
Now the rig is dead but everything works fine on the external battery so I think a strand from one of the wires was touching another solder joint.
Looks tight where all those wires go but I tuned up on 40 meters and I had 5 watts and the RX is fine,display and all else is fine with external battery.
Nothing with internal batteries so you think that tiny diode could be the problem?
Both my meters are in my cargo trailer

I'd suspect a problem with a battery holder at this point. A high-resistance connection in a battery holder could cause the shutting off symptom you've described. If it got worse then the rig could possibly not power-up at all. Could also be a connecting wire problem but IMO that's less probable.

I seem to recall a complaint about battery holders a while back but I don't know if it was in this Group or I read it somewhere else.

Assuming that the 'tiny diode' you're referring to is D5, I very much doubt there's any problem with that. That's a reverse-polarity protection device and would also cause problems powering the rig from an external power source if it were to somehow malfunction.

I had trouble with the original battery holders and solved the problem by changing to holders that had both battery ends touching the contacts rather than having one battery butted up against another. This guaranteed better contact. No further problems. Got the new holders at a hamfest.

Hi Steve,

Thanks for the explanation. But I found I could tune a 20m end fed half wave antenna with the built-in tuner. The antenna was a 34 ft wire with 15 ft counterpoise.

Yes, It tested my patience compared to my L-network tuner. I found the tuning was very sharp. But the tuner did work without any external help and held the match - the LED SWR indicator stayed completely dark any time I would check it.

Noting the approximate position of the tuner in my log book, allowed much faster re-tuning after band switching. Finding the initial setting point is the most time consuming, and needs to be done for every new tree support.

I found the 34 foot wire a convenient size to carry and position vertically. It also worked well on 30 and 40m with the built-in tuner.

I think others have been able to use the built-in tuner with EFHW antennas without external tuners added(?).

So, now you have me curious enough to try end fed half-wave antennas on 30m and 40m too --thanks for the new project idea!

73,

Lynn

Topic: 2211 Message: 2213

The DDS frequency is rarely more then 100 Hz off at 10 MHz. Something is wrong if you measured 10.0700 MHz, or 70 kHz off frequency.

Unless you meant 10.000,070 MHz , I would re-enter the calibration mode which will restore the "factory" default values and use the default values.

Also, the only time there is a signal on TP1 is during calibration or during transmit. During receive, there is no signal there. When you click the menu (keyer) switch to advance to the offset calibartion, the signal on TP1 is turned off.

Maybe,
I went to the spell check on the phone and I hit send instead.
I just went i to get the 8 cell tray for the AA batteries but they no longer carry them.
I spotted that 2.0 mAh 10 volt battery.# 23-379
I also remembered I have my transmitters for my RC planes and they take 8 AA bateries.
I checked the one and it and it says 2.6 mAh so I can just use my 8 sets of batteries and use the TX built in charger because it has a light that goes on when the charge is full and also has a meter

Hi Jim,
I just went back to RS.
Their right in back of where I live but he was closing up so I told him to hang on to the 4 he had left and i'll get those also.
I'll stack 2 packs together and use them as an external supply.
They also have some cheap but good audio ear buds there for $9.00
Part number 33-343, 16 ohms and sound just as good as the Phillips ear buds for double the price.

That Radio Shack battery is Lead Acid (SLA, I'd bet). Probably fairly weighty compared to other chemistries. Still a bargain though. The $x.97 price indicates it's a clearance item so get 'em while you can.

Thanks your quick reply.

I can not get any signal at TP1 in "CAL.r" mode. So my frequency counter and Radio. And It can not receive signal on normal mode.

What device have problem or damage ?

Regards.

Topic: 2225 Message: 2226

if you put a mono plug on the straight key, the rig will detect it and go to straight key mode when you power on. If all you have is stereo plugs, hook the two wires that go to the shaft together, this essentially makes it into a mono plug.

press the first button and release, it will go to set speed mode, and the display shows the speed. hit the dit paddle to decrease the speed or the dah paddle to increase the speed.

this is in the instructions.

2227. RE: [pfr3_group] Sending Speed

Yahoo group: pfr3_group

From: Dale Putnam
Topic: 2225 Message: 2227

the speed of the keyer is on the second touch of hte menu button, where it pops up with "C20".. then by touching one side of the other of the paddle.... it will speed up.. "C24" or slow "c18" in 2 wpm steps. As for the wiring.. the tip of the plug is the contact to ground. And if you have the plug inserted as you turn it on.. the J38 will operate as a straight key...
I may have missed a note there... wire the "ring" of the stereo plug to ground. I use mine with a Baby Black Widow... and leave the Junkers Key for the "big" rig . (Didn't say it was QRO tho)
Have a great day,

THANK_____Q but wrong info:-)
Anyone ever open up one of the Radio Shack 1 million candle power spot lights?
I have one here and that small battery inside will keep that 55 watt bulb going for 45 minutes before it starts to dim.
They were on sale for $9.97 but back to $19.00 again
Another source of cheap battery power.
Later I will be breaking open on of the packs for the cam corder and see if 2 of those packs can be fitted inside.

I personally don't use computer logging software anymore. At my rate of a couple of contacts a week, it's more intrusive than helpful. But if I were in your position, I'd be looking for a particular set of capabilities.

1. QRZ lookup is a big help, that will fill in QTH, Name, distance, azimuth heading for you. Saves you the hassle of looking up the call sign yourself.

2. Ability to export to cabrillo format, which is the format most contests require these days. ADIF is helpful for importing into other loggers, so I would look for at least this if Cabrillo export is not available.

3. Fast search. Computer loggers are useless unless they have this basic ability, IMO.

4. Dupe checker - you want to see all your previous contacts when you enter a call sign, so you can see all the info and comments.

5. Backup - You definitely want a simple way to back up your log, because you will need it later on. Trust me. :)

That would be my minimum list of features. However, if you want to go really minimal, you don't need anything but a spreadsheet program or word processing program.

Just my 2 cents worth.

Hi !

Try the last version (v5) of Ham Radio Deluxe application (http://www.ham-radio-deluxe.com/) with the dedicated module for logging, HRDLogbook. At the first contact it looks very complicated, but in time you will find very useful and covers almost any request. In addition, you can use also this tool to put your LOG on the WEB, using the free service at http://www.hrdlog.net/. If you have eQSL account, you can use Ham Radio Deluxe to upload your QSOs on this site.

Hi !
Yes, I use Ham Radio Deluxe and I'm very pleased. The application consists in a suite of modules, with specific functions, but all communicate with each other. Also, you can use only one module, without be affected.
For logbook feature, the database is very well structurated and allows you to save a lot of information, not only for QSO details but also for propagation conditions. Also, you can export in ADIF format in order to use these file with other applications or WEB services.
For those which own compatible RIGs, the application provides graphical control interface and all the tunings are visible in all software modules, even in HRD Logbook. Also, the Digital Master module works great, especially for PSK modes, but also for CW. The Digital Master module could be also used for SSTV. I don't try it so I can tell you how it works.
So, try it, I think you'll be happy, even at the beginning may seem a little complicated.
And if you like, try also to create an account on hrdlog.net. After the right setup of the application, your saved QSOs will be automatically uploaded (via an Internet connection) to this site. In manual mode you can upload your QSO details to eQSL.cc
Good luck and best 73 !

Subject: [pfr3_group] End Fed antenna and internal tuner

I use nothing but the end fed tuner with 1/4 wires but almost all the time I just use the full 65 foot wire and I have one that is almost vertical so I just leave them. Never lost one yet. I use just about 1 meter attached to the rig to act as a counter poise My tuner is built up on steve yates design and any loss is measured out to almost nothing. Google Steve Yates how to make an end fed work. GK es 73 DXing Bob. AF2Q

From: Richard Powers
Topic: 2243 Message: 2243

I am not sure my DX-CC is doing me any favors on my PFR-3 for 40, 30 & 20 at my home QTH.
Of course I've only had the radio about a week but I can't seem to get out of the midwest.
Maybe it's me.
Are there a couple of popular dipole or vertical antennas for home qth use out there for about $150. or less?

Thanks,
Dick WB9PWQ

From: Felipe Barco
Topic: 2245 Message: 2245

Hello to you!

My name is Felipe, PU2OVA from Brazil.

I'm a First Time builder, and am a little worried. Have already accomplished some other VERY simple projects, non raio related.

I want to build my own QRP TRX, and I`m between the PFR-3 and the Weber Dual Band, from Hendricks as Well.

Doug Hendricks told me to get a PFR-3 because the group could help me if I needed... but I`m a little unsure if the PFR is actually easier than the other one.

Will I be able to build the PFR-3? If so, what`s the average time to do it? Maybe something around 30 Hours?

Well, thanks for your attention!

Kind Regards

Felipe

Yes Felipe,
To both questions, you can build it, in about 30 hours or so. It is completely hole through, no smd to worry about, they are already on the board. Careful attention to detail, and follow the instructions. That's all there is. Have a blast with it.
It works very well, too.
Good Luck, and have fun, both building and using,

My favorite operating position with my PFR3a is from my deck overlooking my back yard. I use the W3EDP end fed wire antenna, which consists of an 85 foot wire up in a tree with 17 foot counterpoise. In the last couple of days I have worked an F5 station from France on 20m and UA3 from Russia on 30m with this antenna. I've been very happy with the PFR3a.

Good luck with your new PFR3a.

Hello Felipe-I think you will enjoy building your PFR3a, and operating it will be even more fun. My advice to you is pretty simple-if this is your first kit, be sure you know how to create a good solder joint and be able to fix a bad solder joint. This is a skill anyone can acquire with a little practice and there are several good tutorials that you can google on the internet. Good soldering technique is critical when you're putting a kit together. You might get an experimenters circuit board and some wire and practice with those before you start your kit. Good luck Felipe, and hope to hear you soon on the air.

2249. Hendricks QRP Kits Announces 3 New Kits for Dayton (available now)

Yahoo group: pfr3_group
Date: 2011-04-06 04:48:46 UTC
From: KI6DS
Topic: 2249 Message: 2249

Hendricks QRP Kits is a regular attendee at Dayton, and this year is no different. If you are in the Ham Radio business, it is important to have new products at Dayton, and Hendricks QRP Kits has 3 new kits this year: The Super Tenna Dipper, the NADC 30, and the CPO, Code Practice Oscillator.

The Super Tenna Dipper is a great tool for finding the 50 ohm resonance of an antenna. It works without connecting the transmitter and is totally self contained in a custom case. An easy to read digital dial makes it a snap to use, and it is an easy build. The parts are through hole and it is a one evening kit. Designed by Steve Weber, it is an improved update of the popular kit sold several years ago by the 4States QRP Group. Price? $75 + shipping. Details, including the manual are on my web page: www.qrpkits.com Scroll down and click on the picture to get details.

The NADC30 is the Nearly All Discrete Components CW Transceiver designed by Steve Weber. It covers the 30 M band, and comes in a custom prepunched case, and features a digital readout. This is a great kit for the beginner, and it is one of the cheapest ways to get on 30 meters. Cost? $130 + shipping. Details are on the web page: www.qrpkits.com. Scroll down and click on the picture of the rig.

The Code Practice Oscillator was a result of my attending Pacificon last fall. Darrel Swenson and Dean Davis gave a presentation and were lamenting that there needed to be a simple kit that does something, and can be built by a beginner in about an hour or so. Ken Locasale designed the Code Practice Oscillator to fill the need. It is a simple kit, utilizing several construction practices. Soldering, wiring, identifying components, and following a schematic. This makes it a great kit for elmers to use to get someone started building. Plus it is also a great kit for clubs. There is a discount for group buys. The cost? $18 plus shipping. Details: www.qrpkits.com.

Not going to Dayton? Looking for a new kit to build? All 3 kits are in stock and ready to ship. Thanks, Doug

2250. PFR-3A For sale

I have a fully assembled, properly working, PFR3A that I completed a year ago. I would like to offer it here first for sale. The unit works as designed, and I have had many fine QSOs with it. It includes the Hendricks Paddles which are now no longer available. I paid $240 for the kit and paddles. The assembly was uneventful, and the rig has worked flawlessly from the beginning. The night before last, from Northwest Ohio, I worked a KH6 station in Hawaii on 5 watts on 20 meters. I am selling this rig because I have my eye on another transceiver kit and I already have an FT-817 additionally. I will sell the rig for $235 plus shipping to U.S. locations.

2259. Group 3 Pretests filed ! NO voltage at L7

Yahoo group: pfr3_group
Date: 2011-04-17 10:28:47 UTC
From: ja0por
Topic: 2259 Message: 2259

Hi to all,

I'm having a problem with the pretests for Group3 Transmitter section.
No voltage at L7 pad next to C57 in Tx mode.

Power up by an external 12VDC supply with a paddle connected.
Installed U8 but L7 is not installed yet.
Voltage measured on pin 1 and 13 of U8 are OK
(0V in RX and 2.5V in TX).

The value of R34 and R35 are OK.
Q5 seems OK ?
Checked OK all connections /solders around (U7 to Q5 then Q6 with associated resistors).

The voltages measured on Q5 and Q6 are:

Q5 in Rx S 0V Drain 12V Gate 0V
Q5 in Tx S 0V Drain 12V Gate 0.86V

Q6 in Rx S 12V Drain 0V Gate 12V
Q6 in Tx S 12V Drain 0V Gate 12V

Q6 Drain 0v means no voltage at L7 pad next to C57 in Tx mode.

The voltage on pin 27 of U7 (Tx enable) is measured only 0.86V
(should be 5V according to IC pin voltage charts on page 24 of the manual)
Wonder why this is pulled down to around 0.86V ?

The resistance check on this pin to ground shows 2.2K which is the value of R53 and maybe Q5 seems not dead short??

What would be the next step to take ???

Alas ! No spare on hand for Q5 Q6 and even U7 (microprocessor)

So far I have completed Group 1 and Group 2 (smoke test done though BFO / CAL not made just leaving it as default)
I can hear many stations on 40m. Its quite sensitive !
Now am enjoying it as an SWL !!

Thanks in advance for any feedback from you...

Date: 2011-04-17 14:36:10 UTC
From: Steve Smith
Topic: 2259 Message: 2261

Hello Mano,

It is difficult to believe but your measurements point to a possible defective U7.

I would measure pin 27 at the I.C. pin, not the socket pin, to rule out a pin to socket problem such as pin 27 bent under I.C.. If that is not the problem then I would remove U7 and apply 5 Volts to the socket pin 27 while monitoring L7 pad. If no voltage at L7 pad, then I would measure the D-S-G of Q5 and Q6.

Best of luck with your troubleshooting.

73.......Steve Smith WB6TNL

From: ja0por
Topic: 2259 Message: 2262

Hello Steve,

Thanks for your nice feedback Bingo !!!

In short my conclusion is that the path for "Tx enable" WAS lost insulation to some extent (marginal for a DVM which can not detect)
and now IS lost insulation completely after appliying an external 5 Volts.

Per your suggestion I removed U 7 and when I applied 5 Volts to the pin 27 I noticed a spark and checked the insulation with a DVM it shows dead short.
Then for narrowing it down I removed R53 still bad and even removed Q5 still bad.
Now as nothing is hang it on "Tx enable" line so path (pattern) it self might be damaged.

Now I got 5V on the pin 27 of U7 in TX without any load.
(measured with Pin 27 leg being bent outer)

So next step for me is to make a direct connections (off board)from U7 to R53/Q5/R35 per schematic while leaving the original path as it is since its very tough to locate the leaking point for this kind of board.

Anyway I need to get some 2N7000 (I spoiled the original Q5 when removing)

Again Steve.. Appreciated !

Cheers Mano JA0POR

PS MY little baby is still OK as a receiver ...

2263. Building pfr3

Topic: 2263 Message: 2263

So I started building the pfr-3a this weekend. I finished group 1 smoke test everything's seems ok. I was missing a couple 102 caps. I also have some blue caps that I guess were substituted for the original tan caps? I will need a meter to I'd them as my eyes are not what they once were. Also I noticed the kit came without any wires for wiring up the case. My kit also did not come with any enameled copper wire for the tortoise. Is this the way the kits come?

The PRF-3A is a nice transceiver. It was a fun build for me and I really have had a lot of fun using it. As per the qrpkits web site.

" If you are missing any part in your kit, please email me at parts@... and I will ship the missing parts to you via first class mail and at my expense. "

HI
Has anyone bought the decoder and successfully installed it in a PFR3?

located here?
http://diy4fun.blogspot.com/2010/02/rotary-encoder-for-ats-assembly.html

I really hate the buttons and would rather use a rotary dial

I have one built but I cant seem to make it work on my PFR3A

tnx
Rich NF8V

I have and did. Mirovslav kits one for the PFR-3 and one for the ATS series.
I had to be very careful as to where I connected the encoder to the PFR3,
but it works fine. What are the symptoms?

Hi Rich,

I believe that Dale has installed at least one.

It shouldn't be too difficult to troubleshoot. What have you tried so far?

That would do it, but you have the wiring figured out for it now.
Do you have a use for it now? If not, how about, I get it from you, then you can order the one for the
PFR3?

Hello Steve,

This to update on my problem ..

Ive got a spare 2N7000 and replaced it.
Now it works fine to switch Q6 on/off when keyed/unkeyed.

Did a quick final test and measured output power on each band around 3.5 to 4.5 Watts (lesser on 20 M) seems OK though some tweaks needed later.

Thanks again Steve for your tip on troubleshooting..

Now I am becoming a happy operator from a happy SWL

Cheers,

Hi Dale
I have the one I built but I lost the knob and led's
It was sitting for awhile and they walked off.
I have a unopened 2nd kit.
Ill take you up on the offer and trade it all for the right one.
I would even send you the radio (when you have it) and pay you to put it together for me, I realy want just to get it going and use it. Im sick of kits right now.
email me your address (rich.ullery@...) and Ill get them sent to you via us mail.
let me know

Hi Rich,
I can understand the feeling... there are times that things just don't go right at all.
My address is:

Dale - WC7S
5503 N. College Dr.
Cheyenne, Wy. 82009

It will take just a bit for an order to get filled, after that, we can getter done.
No problem.
Do you have it mounted now? If not, maybe a very light "x" in pencil for where you want the knob? Or.. I mount them pretty much in the middle of the front panel, between the radio and the case.
If you want to wait to ship, until the encoder arrives, that's ok.. or ship now, and I'll get it all done.
Have a great day,

2275. AUDIO MOD??

Yahoo group: pfr3_group
Date: 2011-04-21 00:40:41 UTC
From: pileupjunkie
Topic: 2275 Message: 2275

I was looking at the pictures and saw this

PFR3 Audio FixPermalink1uf/50v cap added to pin 1(+) and pin 8 of LM386. 470K ohm resistor added to junction of C27 and R14 to ground.

OK I give up.
What was the audio fix?
To boost up audio or fix some other audio bug?

Hi Gang,
I did not build mine but Dale - WC7S was nice enough to send me a built unit to try out.
I really thought the rig had a problem then Dale sent me the link for the instructions and Steve came on the list with very specific instructions on that built in tuner.
Some one else also made a post about the tuner because it does not tune like my Emtec that I have.
Well another person also told me I need safe cracker fingers to tune it so I put up a wire and it was more like doing micro surgery:-)
I now acquired the fine touch needed and I get that led out on all 3 bands.
I don't know who built this kit but it sounds like all parts were hand picked and specs measured before soldering them in.
The RX is super selective and a true 300Hz and sounds good as if the skirts are very steep.
My very first QSO was only 110 miles away but I was able to have the person call me because he just could not believe I was running a bit under 5 watts.
When I heard it over the phone I sounded like a full KW and the CW tone was excellent.
Thanks Steve for making what I feel is one of the best affordable 3 band kits that gives a true 5 watts and a very selective,sensitive receiver.
And Dale,Thanks for putting up with me.
I know I was a PITA but after I had the right material to read it was a GO with no problems.

Hi Dale,
Well you sure did one heck of a good job.
I have to feed my mother twice a day at the nursing home so I take the rig with me because I strung up some wires in the trees at the back of the building.:-)
No building QRM.
But small storms all around and lots of clashing.
Bands are closed so maybe when the Sun storms calm down the bands will open up again.

The 1ufd cap raises the overall volume and the 470k resistor lowers the sidetone volume back to about what it was. You do run the risk of very loud audio in the earphones on a big signal - probably a reason that Steve intentionally kept the gain low. The mod can be done without removing the board from the case. Other options include finding more efficient earphones/headset.

Hi Mike,
Thanks for responding.
I use Phillips Ear Buds and I also located on sale for $9.97,a mice super light weight set at Radio Shack.
They come with different size foam inserts to fit the ears.
Both sets are 16 ohms and give me more then enough audio.
Many times I find myself turning the audio down
Going out now to play radio:-)

Hi Bob,

How about posting the Radio Shack part number for those 'buds.

I do seem to recall early postings regarding apparent low audio on the PFR-3(non-A) but the consensus got down to the sensitivity of the 'phones being used.

Hi Lynn,

I sure would be interested in the paddle kit.

Because I'm on a fixed income (Disability) though, I wouldn't be able to get it until the 3rd of next month.

If you have it then, I would certainly like to purchase it from you.

Please let me know and thank you,

Ren

KG4BAS

BTW, here is the paddle I made for mine. I has a very small foot print.

Hi Ren,

OK, I'll hold onto it till then.

Say, your home brew paddle is a very clever adaptation of that big paper clip! Good going!!

Thank you?

I showed it to Louis Petkus, the designer of the BullDog key and had there been enough interest in the key, he would have listed it on his website… but there wasn't much interest.. :^(

I like it because it has a much smaller footprint than any other key out there and it works really, really well.

Hope you're doing well Lynn, I follow all of your videos on Youtube.

Be well,

Ren

Hi All,
I thought I posted a RS part number for the ear buds.
Maybe RS had some others I was not aware of.
Any way I picked up 2 sets for $9.97
When these non RS buds run out that it.
96dB +- 5dB at 16 ohms and I just tried one set and It really pumped up the audio over the first set that was in an RS box.
These are called AUVIO with the *I* looking like a vertical bar graph
Three different size ear inserts
Their made in China for IGNITION LP in Dallas,TX

Ahh, I love it!!!!!

Someone else noticed it.

Yes, that was one of the primary reasons why I used the BullDog idea. Besides its overall compactness, I use my rig outdoors and not having the □paddles□ out when in travel mode, there is less chance of any adjustment problems with the paddles per se.

Please let me know if you□d like to test out a set, so that I can start production without having to do extra or repeat set-ups of the milling machine.

I□ve also uploaded some photos of the straight key I homebrewed to my KG4BAS folder, should anyone be interested. Contacts are nickel silver and in as much as it weighs in at only 7 ounces, it stays put when in use. Completely adjustable and the main arm sits in ½□ ball race sealed bearings that have been pressed into the main block. There is no side to side movement.

Thanks and be well,

Ren

Ren,

Thanks for the quick reply. The hole layout on the hb1a is exactly the same as for the pfr3a. The Hendricks original paddle fits nicely on the hb1a. I'm now using a Baby Black Widow paddle on the pfr3a and I need something smaller for it when I travel. I'd like to leave the Hendricks paddle on the hb1a in the shack.

Hi Michael,

Thank you for your order. As soon as I get a couple more done, I will contact you with payment amount.

Thank you , I really appreciate your interest in my key.

2306. Paddles for the PFR3A Update

Yahoo group: pfr3_group
Date: 2011-04-28 21:10:33 UTC
From: N. A. Monllor
Topic: 2193 Message: 2306

Hello Everyone,

I started work on the paddles on Monday. I had no 1"x1" stock so I had to cut them from some 1" by 6" 6061 I had in the shop. What a pain in the you know what, considering I do not own a vertical, metal cutting band saw. At any rate, I had enough stock to get 10 bases made and I spent yesterday and today cutting to size and hogging out the bases. I've got 5 done so far and tomorrow I'll finish hogging out the rest of the bases and begin the boring and threading of the holes that will accept the key plug.

The project is moving along nicely but slowly. I expect to have them all done and ready to ship by Tuesday or Wednesday. After meeting with the local QRPers in my club last Monday evening, I've decided on a selling price of $43.00 for the key + $5.20 for Priority Shipping to any USA address, for a total of $48.20.

For those of you who asked, in as much as I have a Paypal account, I prefer checks or money orders as Paypal does charge a fee, and I'm trying to do my best to keep prices down for all of us. If you must use Paypal, for whatever reason, please let me know.

Hope everyone is doing well and 72's,

Ren

Hi Ren,
It would seem to me that the difference between your very respectable price and an even $50 is just a tiny bit above the cut that Paypal wants... so.. IF it is ok with you, I'll send $50 via paypal, to what address for you/the key??
It sounds like a solid deal to me.
Hope all is well with you, and the storms are leaving you alone. We had a beautiful day here, today. Our time with the summer storms is coming.
Have a great day,

Wow Dale, Thank you!!!

My Paypal email is: info@....

Everything here is wonderful, if you like 96* temperatures (something I'm still not used to).

I've been busy in the machine shop making my paddles and enjoying life.

Fortunately for us, the storms have been way north of us, so there have not been any problems with the weather. I will say though that, my prayers go out to those less fortunate who were in the way of the storms. Watching the news, those poor folks have really felt Mother Nature at her strongest.

Well my friend be well and I'll get the paddles out to you just as soon as they are done,

Hi Keith,

I’ve been so busy rounding up the materials, components and starting work, that I didn’t respond because I still hadn’t worked out the price.

You are definitely the second order going out as soon as they’re done.

Thank you so much for the order and I hope you enjoy them.

Your Paypal payment will be fine.

Thank you and be well,

Hi Keith,
I've been so busy rounding up the materials, components and starting work, that I didn't respond because I still hadn't worked out the price.
You are definitely the second order going out as soon as they're done.
Thank you so much for the order and I hope you enjoy them.
Your Paypal payment will be fine.
Thank you and be well,
Ren

Ren,

If I am part of the paddle purchase group (I'm not sure even though I have responded twice), I will do as Dale and Paypal $50 to you. Please let me know.

Thanks

Keith

Wow Dale, Thank you!!!

My Paypal email is: info@monllorrods.com.

Everything here is wonderful, if you like 96* temperatures (something I'm still not used to).

I've been busy in the machine shop making my paddles and enjoying life.

Fortunately for us, the storms have been way north of us, so there have not been any problems with the weather. I will say though that, my prayers go out to those less fortunate who were in the way of the storms. Watching the news, those poor folks have really felt Mother Nature at her strongest.

Well my friend be well and I'll get the paddles out to you just as soon as they are done,

Hi Ren,
It would seem to me that the difference between your very respectable price and an even $50 is just a tiny bit above the cut that Paypal wants... so.. IF it is ok with you, I'll send $50 via paypal, to what address for you/the key??
It sounds like a solid deal to me.
Hope all is well with you, and the storms are leaving you alone. We had a beautiful day here, today. Our time with the summer storms is coming.
Have a great day,

Subject: [pfr3_group] Paddles for the PFR3A Update

Hello Everyone,

I started work on the paddles on Monday. I had no 1”x1” stock so I had to cut them from some 1” by 6” 6061 I had in the shop. What a pain in the you know what, considering I do not own a vertical, metal cutting band saw. At any rate, I had enough stock to get 10 bases made and I spent yesterday and today cutting to size and hogging out the bases. I’ve got 5 done so far and tomorrow I’ll finish hogging out the rest of the bases and begin the boring and threading of the holes that will accept the key plug.

The project is moving along nicely but slowly. I expect to have them all done and ready to ship by Tuesday or Wednesday. After meeting with the local QRPers in my club last Monday evening, I’ve decided on a selling price of $43.00 for the key + $5.20 for Priority Shipping to any USA address, for a total of $48.20.

For those of you who asked, in as much as I have a Paypal account, I prefer checks or money orders as Paypal does charge a fee, and I’m trying to do my best to keep prices down for all of us. If you must use Paypal, for whatever reason, please let me know.

Hope everyone is doing well and 72’s,

Ren

2317. Problem in iambic mode

Yahoo group: pfr3_group
Date: 2011-05-03 12:30:39 UTC
From: biyon_n
Topic: 2317 Message: 2317

Dear Everyone,

This is 7M1CPS from Japan. I am writing for the first time.

I have just made PFR-3 kit. It works well. I am impressed its sensitivity and frequency stability.

However, there is some trouble in transmitting with iambic mode.
The trouble is that, for example, when I send CQ through internal keyer, the signal heard with another receiver is as if it is a long dash. The end of each signal seems to be delayed and all signals connected. Side tone is heard quite normal, though.
This problem is not occurred when I am using straight key mode with external keyer adjusted same speed. Straight key mode makes quite normal signal. So, I guess it is not a problem in RF part.

If there could be any comments to solve this problem, I would be grateful.
Thank you.

Masahiro/7M1CPS

Bob,

You can disable the internal keyer, by using a monaural plug in the paddle jack, on power up. Then you can use you external keyer or a straight key.

2321. Batteries for the PFR-3

Yahoo group: pfr3_group
Date: 2011-05-03 16:00:51 UTC
From: Richard Powers
Topic: 2321 Message: 2321

Well, I messed up when I was at a Hamfest this past Sunday and forgot to get some batteries for my PFR-3. I walked right past the Battery Guys too - Can't remember their name or the web address.
Anyway, I wouldn't know exactly what kind of batteries to ask for since there are so many types.
I also need to know where to get them. I'm not sure if I should go to the local Radio Shack or not for a Radio as special as the PFR-3.

Any advice?
Thanks,
Dick WB9PWQ

Hello Masahiro,

I can think of nothing that would cause the problem you describe except for U7. If it were outside of U7 then you would have the problem also in straight key mode.

Are you testing with a dummy load connected to the antenna port?

To confirm U7, monitor the voltage at R53 (2.2K) opposite the ground end. If all is OK with U7 the voltage should follow your paddle input.

Best of luck troubleshooting the problem.

Date: 2011-05-03 22:30:43 UTC
From: biyon_n
Topic: 2317 Message: 2323

Hello Steve,

Thank you for the comment.

I compared the voltages between iambic mode and straight key mode at some points.
Observation at pin 25 (mute) of U7 was somewhat different.
It read about at 2.5 volts with a little vibration (I used an analog voltmeter) when I sent continuous dots in straight key mode. It was an avarage of 5V (RX) and 0V (TX). I used a Curtis-made external keyer.

On the other hand, when I operated the iambic mode, the voltmeter read almost zero constantly while sending continuous dots or dashes.

At the pin 27 (ie. R53), observations were not different between two modes. In both mode, it indicated the avarage of 0V (RX) and 5V (TX) with a little vibration.

Now I also think it would be some issue on U7.
I wonder if I had done something wrong in the smoke test, or something.

Thank you.

2324. I CAN USE SOME HELP PLEASE

Yahoo group: pfr3_group
Date: 2011-05-04 05:13:57 UTC
From: OllySteed@aol.com
Topic: 2324 Message: 2324

First off I have to admit after being a ham for 34 years I never heard of
a monaural plug.
I tried all my plugs and adapters and I still can't disable the rigs keyer.
Radio Shack,Well they never heard of it so i'm still with the built in
keyer.
No problem with that but it would be nice to have the function.
The second problem I have is when I go to the *M* in the menu and the RX
mutes out,I put in CQ and my call several times.
I have to hit the menu button to hear my message.
All the nice smooth letters I put in when it plays back just sends out
random dits and Dahs and at times I will hear my call in the mess of unwanted
characters.
Not concerned with that since I never use that function on any other rigs
I have.
But the external keyer just sends dits weather I hold the dit or dah side
of the paddle.
So it looks like this monaural plug is some sort of different beast?
I'm doing all this in the tune mode and a dummy load.
All else is working fine 5+ watts on all bands.
Any help much appreciated.
Thanks
BOB
AF2Q

2325. Re: [pfr3_group] I CAN USE SOME HELP PLEASE UP DATE!!

Yahoo group: pfr3_group

From: OllySteed@aol.com
Topic: 2325 Message: 2325

Hi Gang,
4 AM here and i'm still trying to get the PICO keyer working with the pfr3.
I did something and I have the straight key mode now.
However the PICO keyer sends dots with both paddles.
I can adjust the speed so that works.
The 2 PICO keyers both work in the FT 817 and the 2 band China rig.
But one sends dots and the second one just sends a steady carrier with the
pfr3 rig
~~~~>If a monaural plug is in the paddle jack at power up (the sleeve
grounds the dash input pin), the rig will power up in straight
key mode. This allows using either a straight key or external keyer. While
in straight key mode, none of the keyer switch
functions will be available. If a message has been previously stored in
the keyer memories, only memory location 1 will be
available, (tap the straight key closed with in 1 second of clicking the
keyer switch) as this is selected with the dot input pin,
now controlled by the straight key.
So I can use a straight key,or use one side of the paddle so that should
confirm I am in the straight key mode but when I hook up the PICO keyer I
think there is some sort of conflict.
Is anyone here using the PICO keyer with the pfr3?
Thanks
BOB

I had the "stored message gibberish" with a PFR3A. It played back terribly in the "message test" mode, but after storing it (by pressing the dit or dah), it played fine into a dummy load. I have no idea why, but that's what mine did. The plain early version PFR3 never did this.

The PK3, PK4 and an N0XAS keyer work on both PFR3 versions here. I use a 3.5mm mono jumper, make sure the jumper is plugged into the PFR before you power it up. I found the tune function disappears, and only the message in the "dit" memory stays as described.

Hi:

I have experienced the jibberish when I first stored a message too. First off, only memory 1 is active when in straight key mode cause the dah paddle is grounded when you use the mono plug.

When entering your message, there is a timing issue you need to be aware of, especially with letters. So what I did was to lengthen the space between letters. You have to try it a few times to get the hang of it. If you lengthen the space between characters too much, then it gets interpreted as a space. Bottom line, keep the character speed equal, just lengthen the timing between characters a bit and make your word spaces longer. If your external keyer has memories, I would use them and let the external keyer do the work .

Good luck. This is a great rig. Once you get it setup and operating the way you like it, it works absolutely fantastic. Almost time for me to get the patio table up and move the shack outdoors! HI HI.

When entering your message, there is a timing issue you need to be aware of, especially with letters. So what I did was to lengthen the space between letters. You have to try it a few times to get the hang of it. If you lengthen the space between characters too much, then it gets interpreted as a space. Bottom line, keep the character speed equal, just lengthen the timing between characters a bit and make your word spaces longer. If your external keyer has memories, I would use them and let the external keyer do the work .

Good luck. This is a great rig. Once you get it setup and operating the way you like it, it works absolutely fantastic. Almost time for me to get the patio table up and move the shack outdoors! HI HI.

I had the "stored message gibberish" with a PFR3A. It played back terribly in the "message test" mode, but after storing it (by pressing the dit or dah), it played fine into a dummy load. I have no idea why, but that's what mine did. The plain early version PFR3 never did this.

The PK3, PK4 and an N0XAS keyer work on both PFR3 versions here. I use a 3.5mm mono jumper, make sure the jumper is plugged into the PFR before you power it up. I found the tune function disappears, and only the message in the "dit" memory stays as described.

Hi- I did not see anyone else mention this (and it might not work with your particular keyer).
When I want to use my little external Winkeyer with the PFR, I used the manual's procedure for setting it for straight key/tune mode: I plugged in the iambic key, held down the "dash" side and turned the power on. I then ran the output from my keyer to the PFR to generate the CW. I usually only do this when I need the winkeyers sequential serial numbers feature for some contests. The disadvantage is that some of the other PFR features such as RIT and direct freq entry are disabled in this mode.
Good luck es 72 de john/k7hv

Hi John,
I just came in and I did stop at the Rat Shack but they wanted an arm and $8.99 for that cord
It works with the 2 band China rig so I may have a bug in the pico keyer.
One person sent me this note
~~~>The PK3, PK4 and an N0XAS keyer work on both PFR3 versions here. I use a 3.5mm mono jumper, make sure the jumper is plugged into the PFR before you power it up. I found the tune function disappears, and only the message in the "dit" memory stays as described.
I have to grab some food and get back on this project.
I will post my results later.
Thank you very much for responding.

Thank you,everyone who responded.
The problem was a new mono cord I purchased several months ago.
It has a short in that cord.
I located another one in the junk box and found a thinner one, and one end has a nice 45* mono plug in it.
I put that in and POOF,just like magic it's working like it should.
Another person told me about the setting the spacing for the message at a slower speed.
I tried that and it now sends out that message and sounds just as good as W1AW..
Once again,
Thank you to all who took the time to post the tips and suggestions.
The built in keyer speed control is very easy and fast and I doubt that I will use the PICO keyer but at least I now know everything is like it should be.
Thanks for all the help.
Now I can get some sleep:-)

2333. PFR3A Paddle Update

Yahoo group: pfr3_group
Date: 2011-05-05 16:16:12 UTC
From: Ren
Topic: 2333 Message: 2333

Good morning folks,

Yesterday I shipped the first three paddles to Dale (WC7S), Keith (WA9S) and Timothy (K6OM). Charlie,s (W8OEY) paddle is going to the Post Office as soon as I'm off the computer. According to the postman, Dale, Keith and Tim should be receiving them on Friday. Bob (AF2Q), your paddles are done and I'm just waiting on your check to arrive.

I tested each paddle using my PFR3A radio before I packed them and they worked just fine. I included the 2, 4-40 mounting screws needed to attach the key to the radio.

Since yesterday, I have changed 1 hole demension by .014", allowing for better clearance of the plug wires. Should either of you guys decide you would like me to do the same to your bases let me know, and we'll get it done.

The reason for the change is because when first assembling the paddle, there would be contact made with the base of the plug, grounding the dit side of the paddle. On your paddles, I insulated the base of the plug and it worked just perfectly, so I shipped them like that. Again, if you'd prefer the reworked base just let me know and we'll work something out, without a problem.

If you have ideas as how to make a better paddle, please, please, please, let me know.

FYI: I was told by a couple of people that these particular paddles would fit the HB1A, KX1, and a couple of the TenTec radios, I designed them for the PFR3A. Personally, I would not use them on those radios as, in as much as the keys will work, there will be no additional support of the base to the radio, other than the plug itself, placing a large amount of side to side pressure on the key plug shaft. I'm in the process of designing keys for those radios using the bulldog clip for the paddles, offering owners of those radios, the same benefits of the PFR3A Paddles.

Guys, thank you for your orders, patience, and trust. I hope that you are happy with the paddles. If you are, please let others and myself know. If you're not, please let me know so as to take proper care of the problem.

Again, all be well and enjoy,
Ren

2335. Substituting Wires

Yahoo group: pfr3_group
Date: 2011-05-06 18:59:45 UTC
From: Felipe Barco
Topic: 2335 Message: 2335

Hello, folks!

Well, I bought a PFR-3 kit, which arrived last week.

Everything came in, except for the wires.

I went to buy them today in the morning, and I was succesful finding Magnet AWG 28. I didn't find the Magnet Wire AWG 30, only found bare copper, which I bought because the store didn't know when they would have the magnet one.

Can I use this wire? If Yes/No, why?

As I can see, the turns on L1 don't touch each other. A friend told me I could use some regular varnish on the wire before winding it. If I have to, I can wait until the store has more of the Magnet Wire, but I'd like to don't stop building it.

Also, I bought regular coated AWG 24 wire. This is the correct one, right?

I'm sorry for all the questions.

Thank you in advance,

Kind Regards
Felipe

Hello Felipe,

Bare wire will work just fine as long as it doesn't contact another bare copper winding or some other conductor external to the toroid.

You should also contact one of the Dougs for replacement wire. They need to know that it was missing.

Best of luck with your kit.

2339. AGC Change?

Yahoo group: pfr3_group
Date: 2011-05-08 20:49:35 UTC
From: James
Topic: 2339 Message: 2339

Would it be possible to increase the AGC time constant without messing things up? Seems most of the folks I work on QRP are in the 10-13 WPM range. The Pfr-3 AGC is a bit fast, giving a "pop" at the start of each new word. It works fine on 20 wpm code.

I found a post where Kd1JV mentioned the AGC time messing with QSK. What it would mess up and which resistor or capacitor to change is beyond me.

Any ideas from the knowledgeable among us?

Thanks

James,
A year ago KD1JV replied to my problem with "popping" AGC explaining it as an inherent drawback of audio derived AGC, but the solution is to adjust (detune) the RX gain when you have strong signals. Works for me.

Hello!!

Thank you for your replies! I spent my weekend without any internet
conection, so I couldn't answer before.

I'll try the double winding technique, for sure! I think I'll paint the wire
with nail polish, to isolate it!

Today, I think I'll finish Part 1.

Many thanks!!

Kind regards
Felipe

2344. Introducing New Book from Adrian Weiss at Dayton

Yahoo group: pfr3_group
Date: 2011-05-13 14:31:42 UTC
From: dean@alpinesoft.com
Topic: 2344 Message: 2344

Adrian Weiss W0RSP?s new long-awaited book, IONOSPHERIC PROPAGATION, TRANSMISSION LINES, and ANTENNAS for the QRP DX?r, will be introduced at Dayton 2011 in the searchable-PDF format on CD. The author provides the following description:

The book examines the significant factors that influence the strength and coverage of a QRP h.f. signal on its journey from transmitter to distant receiver, with special attention to QRP DX?ing. Chapter 1 is an overview in which various types of loss factors are interrelated including the antenna systems at both ends and the nature of the ionospheric path itself. The tedious down-and-dirty details, data and theories (and a few formulae) are discussed in later chapters. Pages 26 to 52 of Chapter 1 are devoted to an explanation of the application of current MUF3000 contour maps available on the WEB and seven recommended propagation analysis software programs (included on the CD).

In addition to the new CD book I will also have a limited number of signed copies of his Joy of QRP book and the History of QRP available at FDIM vendor night at the Holiday Inn in Fairborne. Look for special pricing.

From: OllySteed@aol.com
Topic: 2352 Message: 2352

I was checking each rig to see how much noise I would pick up today with all the rain we had.
I ave up and fired up the ICOM 7000.
I picked up a very week station on 7.037.80.
I had the pfr3 and the HB1A sitting on the floor so I decided to see if they could pick up the station.
through the S8+ QRM the pfr3 picked up the station loudest at (BEST)7.037.10 and the HB1A picked up the same station at 7.037.90.
I can't say this is a lab type test plus I had the filters in the ICOM cranked down tight.
The pfr3 had fresh AA batteries installed and the HB1A was showing 9.12 volts.
Now on transmit both rigs are within 10 Hz of each other.
Audio on the pfr3 seemed to be close to 1/2 of the HB1A rig.
Both rigs in the past always got good reports and when I heard a station calling CW I responded and they came back.
I only us the RIT to suit my own ears.
HB1A picks up W1AW spot on and the pfr3 is about 2 Hz off.
I just don't understand the spread between the 2 rigs picking up one station but both are only 2 Hz of each other at the W1AW frequency.
I still have everything hooked up hear and will be checking everything over again.

2353. TWO MORE TEST

Yahoo group: pfr3_group
Date: 2011-05-17 18:08:18 UTC
From: OllySteed@aol.com
Topic: 2353 Message: 2353

OK I was playing with the filters on the IC 7000 and I think I marked down a frequency of a station then narrowed the rig down and was getting another station.
I am now listening to CW on 7.026.11
Hb1A is showing 7,06.11 and the pfr3 is showing 7.026.1
Sometimes I set the ICOM for my ears,the highest bars graph reading or the 600 Hz tone.
I knew something was strange because both rigs are with in 2 Hz on W1AW.
I may have hit the VFO dial.
Also both rigs were still getting a lot of QRM and that helped me zero in on the loudest tone.
Noise in the IC 7000 with the filters was nothing to even think of plus the MAG LOOP nulls out most of it.

Hello...

Here I come again, to ask for some help (there will be a day when I'll be able to help someone).

The manual tells me to turn the BFO Trimmer 1/4 turn from the factory setting... Well, I fussed with the trimmer, and can't get it back to the factory settings... If someone could, please, give me the position to the trimmer, I'd be much thankful.

Thank you in advance.

Kind regards.

Felipe

2358. Adjusting tuner by Received Noise Level?

Yahoo group: pfr3_group
Date: 2011-05-18 13:29:43 UTC
From: James
Topic: 2358 Message: 2358

Does anyone just peak the received noise level and select "HI-LO" based on if antenna is < or > 1/4 wave and not worry about looking for LED dimming?

How risky would this be? Let's assume a reasonable dipole or vertical wire and counterpoise are attached to the terminals.

From: Steve Smith
Topic: 2358 Message: 2359

Probably not too 'risky' although, if the mismatch is very bad and you are in the "Operate" switch position, there is a possibility that the output transistors could be damaged.

The probability is that you won't be operating with the best efficiency, i.e. you might not get out very well.

Bottom line is: Use the LED for best match indication. If you are visually impaired and can't see the LED then some voltage-to-tone indicator might be best.

From: OllySteed@aol.com
Topic: 2358 Message: 2361

What I do is put the rig in receive mode then peak for MAX noise.
Tune SLOW.
Then put the rig in the TUNE position.
Again tune slow.
I find when I tune like this that I never have to turn the knobs more then say the thickness of a dime.
They are touchy but you get used to it.
I use an end fed wire and it tunes that very well but remember to flip the switch toward the *RED* binding post.
A short random wire about 5-8 feet clopped on to the ground of the coax connecter seems to make tuning the random wire a bit easier.
Bottom line is if the light is not out then SWR is up.
Even a very dim LED is better then a bright one no matter how resonate the antenna is because you need to match the rig to the antenna to the rig.
Remember also you should be able to check the SWR with a small meter in line with the COAX type antenna.
The random wire you need to depend on the LED.
I hope this was of some help.

Thank you very much!

I don't know if I got it, though.

My problem is with the BFO Trimmer (C16), and not the BFO Cap (C 1/2).

As far as I understood, and I'm very sorry if I got it wrong, the instructions you gave me are for the BFO Capacitor.

The manual says to turn the Trimmer (C16 - Green, small, varicap) 1/4 turn from the factory setting. I lost the factory setting.

Since I can change it from minimum capacitance to maximum, I wonder in which position I have to adjust it.

I guess if it's wrong adjusted, I won't be able to adjust the BFO Cap (C 1/2) correctly.

Thank you

Felipe,
Turning the trimmer clock wise until it stops will give you the MAX.
I also found this to be true on other QRP rigs also.

Hi Felipe,
If you set it "wrong" then you may not be close enough to answer the other stations cq. And it may affect the over all rx sensitivity.
If you set the little green cap to where the tiny arrow is in line with the edge of the board, that would be a good place to start.
I usually run through the rx alignment 3, maybe 4 times, so I can insure that the rx sidetone matches the tx signal.. the tx signal is then
within the filter of the answered station.
IF this doesn't make sense, please contact me direct, and we will work through it, if you want to.

2366. PFR3A paddle review

Yahoo group: pfr3_group
Date: 2011-05-19 18:59:43 UTC
From: Ren
Topic: 2366 Message: 2366

Hi guys,
I received my first review on the paddles I sent to Dale (WC7S) in Wyoming, and I post it here:

I received my paddle from Ren in a very short delivery time, packed securely, and upon receipt, I did away with the packing on the way to the ham shack. No one noticed.. did they? Well.. not if they were in the next county... everyone else should have...
I quickly set up the PFR3, and plugged in the key.......
oh oh.... hmmmmmmm now what the.... well.. ok.. this is a test model.. and a testing we shall go...
a quick phone call discussion with Ren, and the issue was corrected, and will be on future keys too.
So.. up on twenty... yep, it's open... and a couple of "test"... adjust... "test"... yep.. off we go..
Yes, adjusting the key is just that simple. And correcting issues is a breeze too. But it is one TUFF key.
With the paddles folded down.. it will withstand substantial untoward bumps and bruises with out
failing. It adjusts to easily handle my cw... and will work fantastic with gloves, and without. I don't like holding my key hand up to the campfire to keep it warm, while the other fellow is sending. So having gloves on, and keeping my hand on the key is nice.
It adjusts easily to that situation. Then without a whimper, it moves easily to a warm summer night, with a light touch and warm hands after a hot day, to running along a nice comfortable speed too.
No muss, no fuss, just a solid key, built to use. Emphasize USE!

--... ...-- Dale - WC7S in Wy.

I'd appreciate hearing from the other folks who have used their paddles, hope they met your expectations.

Thank you all,
Ren

Hi,
The stiff wire supporting each paddle can be squeezed closer to the center of the key, thus lightening the touch. That is exactly the coolest thing, because I can make an adjustment with almost anything.. a pocket knife, or horse pick, with or without gloves on.. and it never fails... once set... no screws to come loose. Pretty cool, right?

oh oh.... hmmmmmmm now what the.... well.. ok.. this is a test model.. and a testing we shall go...
a quick phone call discussion with Ren, and the issue was corrected, and will be on future keys too.
So.. up on twenty... yep, it's open... and a couple of "test"... adjust... "test"... yep.. off we go..
Yes, adjusting the key is just that simple. And correcting issues is a breeze too. But it is one TUFF key.
With the paddles folded down.. it will withstand substantial untoward bumps and bruises with out
failing. It adjusts to easily handle my cw... and will work fantastic with gloves, and without. I don't like holding my key hand up to the campfire to keep it warm, while the other fellow is sending. So having gloves on, and keeping my hand on the key is nice.
It adjusts easily to that situation. Then without a whimper, it moves easily to a warm summer night, with a light touch and warm hands after a hot day, to running along a nice comfortable speed too.
No muss, no fuss, just a solid key, built to use. Emphasize USE!

--... ...-- Dale - WC7S in Wy.

I'd appreciate hearing from the other folks who have used their paddles, hope they met your expectations.

Thank you all,
Ren

Hi,
The stiff wire supporting each paddle can be squeezed closer to the center of the key, thus lightening the touch. That is exactly the coolest thing, because I can make an adjustment with almost anything.. a pocket knife, or horse pick, with or without gloves on.. and it never fails... once set... no screws to come loose. Pretty cool, right?

Just Squeeze the wires that support the paddle arms, a little bit closer to the Bulldog clip.

Ren and Dale,

I am getting used to it but I would like a lighter touch for my 25 wpm speed. It worked first time and I worked K6JSS/8 at FDM in Dayton last night. Is there a way to lighten up the amount of pressure required? Thanks.

Keith

Hi guys,
I received my first review on the paddles I sent to Dale (WC7S) in Wyoming, and I post it here:

I received my paddle from Ren in a very short delivery time, packed securely, and upon receipt, I did away with the packing on the way to the ham shack. No one noticed.. did they? Well.. not if they were in the next county... everyone else should have...
I quickly set up the PFR3, and plugged in the key.....
oh oh.... hmmmmmm now what the.... well.. ok.. this is a test model.. and a testing we shall go...
a quick phone call discussion with Ren, and the issue was corrected, and will be on future keys too.
So.. up on twenty... yep, it's open... and a couple of "test"... adjust... "test"... yep.. off we go..

Dale,

I bought my PFR-3A last year at Dayton, built it quickly and have been having a grand time using it with our local Adventure radio Group. My FT-817 may just end up bolted into my Jeep Wrangler as permanent mobile. I have Ren's paddle and the original paddle offered by Hendricks. This year I may bite the bullet and get a Buddipole.

K5ACO DE NG9D - hi Jim!

In my opinion, there would be no reason to not tune the system. It is so easy, and results in best signal. Here is an 11 second look at the tuner with a 160 ft end fed wire antenna:

http://www.youtube.com/watch?v=GqdibNBxyBc

Built-in Antenna Tuner - Minimum SWR is indicated by dimming of LED. Tuning involves setting antenna switch on back to "balanced line", selecting "High Z" for high input impedance (i.e. voltage fed) or "Low Z" for low impedance (current fed) input, and then adjusting two variable capacitors for resonance. Video shows how LED dims when feed line is matched. In this demonstration, 160 foot end fed wire is matched without feed line or counterpoise on 20 meters.

The length of that antenna 48.8 meters was 2.28 times the 21.35 meter wavelength at 14.052 meters. I expected that wire would tune better in Low Z but found the opposite. A little experimenting is sometimes needed depending on the wire lengths and nearby objects.

Oh... and don't forget to re-set switch from "tune" to "operate" ... if you are forgetful like me! More than once, I finished a QSO and discovered I was operating in tune -- as a QRPp station! --yet another "senior moment"!!

Here are five more antennas:

34 foot end fed: http://www.youtube.com/watch?v=3kWvXJ_5XgE&feature=related
50 foot doublet and home made twin wire feeder:
http://www.youtube.com/watch?v=qaUN9m2u1pQ&feature=related
300 foot loop: http://www.youtube.com/watch?v=hUJiK9eQ0K0
150 foot doublet: http://www.youtube.com/watch?v=b6csjsbm7vE

Finally, for those of you who like kit building and portable CW, you will have an absolute blast if you build this rig! This is a very enjoyable kit building experience. Assembly is straightforward, and any adjustments are simple without need for expensive test gear. The wide-range manual tuner and internal power with 8AA rechargeable Ni-M-H (2500 mA-hr) batteries make it easy to transport, set up and use. Have fun!

Subject: Re: [pfr3_group] Adjusting tuner by Received Noise Level?

What I do is put the rig in receive mode then peak for MAX noise.
Tune SLOW.
Then put the rig in the TUNE position.
Again tune slow.
I find when I tune like this that I never have to turn the knobs more then say the thickness of a dime.
They are touchy but you get used to it.
I use an end fed wire and it tunes that very well but remember to flip the switch toward the *RED* binding post.
A short random wire about 5-8 feet clopped on to the ground of the coax connecter seems to make tuning the random wire a bit easier.
Bottom line is if the light is not out then SWR is up.
Even a very dim LED is better then a bright one no matter how resonate the antenna is because you need to match the rig to the antenna to the rig.
Remember also you should be able to check the SWR with a small meter in line with the COAX type antenna.
The random wire you need to depend on the LED.
I hope this was of some help.

They are touchy but you get used to it.
I use an end fed wire and it tunes that very well but remember to flip the switch toward the *RED* binding post.
A short random wire about 5-8 feet clopped on to the ground of the coax connecter seems to make tuning the random wire a bit easier.
Bottom line is if the light is not out then SWR is up.
Even a very dim LED is better then a bright one no matter how resonate the antenna is because you need to match the rig to the antenna to the rig.
Remember also you should be able to check the SWR with a small meter in line with the COAX type antenna.
The random wire you need to depend on the LED.
I hope this was of some help.

Does anyone just peak the received noise level and select "HI-LO" based on if antenna is < or > 1/4 wave and not worry about looking for LED dimming?

How risky would this be? Let's assume a reasonable dipole or vertical wire and counterpoise are attached to the terminals.

K5ACO

What I do is put the rig in receive mode then peak for MAX noise.
Tune SLOW.
Then put the rig in the TUNE position.
Again tune slow.
I find when I tune like this that I never have to turn the knobs more then say the thickness of a dime.
They are touchy but you get used to it.

Thanks Dale. I re-read what I wrote during this morning's coffee and noticed a few mistakes. Anyway here is one correction:

The length of that antenna, 48.8 meters, was 2.28 times the 21.35 meter wavelength at 14.052 MHz.

K5ACO DE NG9D - hi Jim!

In my opinion, there would be no reason to not tune the system. It is so easy, and results in best signal. Here is an 11 second look at the tuner with a 160 ft end fed wire antenna:

http://www.youtube.com/watch?v=GqdibNBxyBc

Built-in Antenna Tuner - Minimum SWR is indicated by dimming of LED. Tuning involves setting antenna switch on back to "balanced line", selecting "High Z" for high input impedance (i.e. voltage fed) or "Low Z" for low impedance (current fed) input, and then adjusting two variable capacitors for resonance. Video shows how LED dims when feed line is matched. In this demonstration, 160 foot end fed wire is matched without feed line or counterpoise on 20 meters.

The length of that antenna 48.8 meters was 2.28 times the 21.35 meter wavelength at 14.052 meters. I expected that wire would tune better in Low Z but found the opposite. A little experimenting is sometimes needed depending on the wire lengths and nearby objects.

Oh... and don't forget to re-set switch from "tune" to "operate" ... if you are forgetful like me! More than once, I finished a QSO and discovered I was operating in tune -- as a

QRPp station! --yet another "senior moment"!!

K5ACO DE NG9D - hi Jim!

In my opinion, there would be no reason to not tune the system. It is so easy, and results in best signal. Here is an 11 second look at the tuner with a 160 ft end fed wire antenna:

Here are five more antennas:

34 foot end fed: http://www.youtube.com/watch?v=3kWvXJ_5XgE&feature=related
50 foot doublet and home made twin wire feeder:
http://www.youtube.com/watch?v=qaUN9m2u1pQ&feature=related
300 foot loop: http://www.youtube.com/watch?v=hUJiK9eQ0K0
150 foot doublet: http://www.youtube.com/watch?v=b6csjsbm7vE

Finally, for those of you who like kit building and portable CW, you will have an absolute blast if you build this rig! This is a very enjoyable kit building experience. Assembly is straightforward, and any adjustments are simple without need for expensive test gear. The wide-range manual tuner and internal power with 8AA rechargeable Ni-M-H (2500 mA-hr) batteries make it easy to transport, set up and use. Have fun!

Dale,

I bought my PFR-3A last year at Dayton, built it quickly and have been having a grand time using it with our local Adventure radio Group. My FT-817 may just end up bolted into my Jeep Wrangler as permanent mobile. I have Ren's paddle and the original paddle offered by Hendricks. This year I may bite the bullet and get a Buddipole.

Hi,
The stiff wire supporting each paddle can be squeezed closer to the center of the key, thus lightening the touch. That is exactly the coolest thing, because I can make an adjustment with almost anything.. a pocket knife, or horse pick, with or without gloves on.. and it never fails... once set... no screws to come loose. Pretty cool, right?

Subject: [pfr3_group] PFR3A paddle review

Hi guys,
I received my first review on the paddles I sent to Dale (WC7S) in Wyoming, and I post it here:

I received my paddle from Ren in a very short delivery time, packed securely, and upon receipt, I did away with the packing on the way to the ham shack. No one noticed.. did they? Well.. not if they were in the next county... everyone else should have...
I quickly set up the PFR3, and plugged in the key.....
oh oh.... hmmmmmmm now what the.... well.. ok.. this is a test model.. and a testing we shall go...
a quick phone call discussion with Ren, and the issue was corrected, and will be on future keys too.
So.. up on twenty... yep, it's open... and a couple of "test"... adjust... "test"... yep.. off we go..
Yes, adjusting the key is just that simple. And correcting issues is a breeze too. But it is one TUFF key.
With the paddles folded down.. it will withstand substantial u ntoward bumps and bruises with out
failing. It adjusts to easily handle my cw... and will work fantastic with gloves, and without. I don't like holding my key hand up to the campfire to keep it warm, while the other fellow is sending. So having gloves on, and keeping my hand on the key is nice.
It adjusts easily to that situation. Then without a whimper, it moves easily to a warm summer night, with a light touch and warm hands after a hot day, to running along a nice comfortable speed too.
No muss, no fuss, just a solid key, built to use. Emphasize USE!

--... ...-- Dale - WC7S in Wy.

I'd appreciate hearing from the other folks who have used their paddles, hope they met your expectations.

Thank you all,
Ren

Dale,

Same price $399 but they are shipping it to me for $15 and no sales tax which is 7% in Ohio. Steve Weber has come out with an antenna dipper kit for $75 for tuning antennas. Should be great for adjusting the Buddipole. I hate to spend the $399 but the PFR-3A is worth it.

2380. Last (I Hope!) Help with my PFR-3

Yahoo group: pfr3_group
Date: 2011-05-29 19:46:13 UTC
From: Felipe Barco
Topic: 2380 Message: 2380

Hello, friends!

Well, I managed to take building the PFR-3 to the end! =) Yey!

But, I need some info, if you please could help!

1. By the time I was in Part 2, I didn't have access to an antenna for moving reasons. So, I couldn't do all the calibration process. The question is: If I try to do it with the PFR-3 complete, when in calibration mode, will the TX put out any power? I'm afraid my antenna is not tuned and something could be damaged.

2. One last thing to complete the building: T3. As the wires were missing, I bought them myself. The wire used to Wind T3 is regular #24 or magnet Wire? I have both, but want to go on the correct one!

Thank you very much!

Regards

Felipe

Congratulations Felipe,
On a successful build.. well it will be in just a little bit.. right?
In calibration mode, it will put out power if you tx.. if something isn't right, like you key the tx.. so.. don't do that. My reason for not... is that I am likely to key into a rx.... or a counter. Not good. So... for the outside stuff, I will try very much not to key the tx. Now for the mismatched antenna issue, that is why I always use a 9v battery for power during the calibration, and initial tuneup phases... even when I am portable, I will use a 9 v battery many times... and continue with it for the Q.... no it won't last a very long time.. but it works just fine for many a Q.
Another addition that I have on mine is a power tune up switch.. that adds a 5 ohm resistor in series with the battery feed... so the radio can't push too much power, in tuneup.
Yes, it is over cautiousness.. but then.. I don't have to have a lotta power to see the led, and tune the tuner anyway.
And.. the batteries like me for it. So do the finals.
As for the T3 wire.. as long as it is insulated with enamal and you are careful to insure proper soldering, you can use about any of the correct sized wire you want. If you use enamaled wire be very careful NOT to nick the wire while scraping it clean to solder it. ANY nick will prove to be the point of failure, at the most inappropriate time... miles away from a soldering iron, and with only the one antenna that has to have a tuner... not good, after a day of hauling it along... only to find it not useable.. because a nice nick failed.
Good Luck, and maybe one day we can do a PFR3 to PFR3 Q ,
Have a great day,

Subject: [pfr3_group] Last (I Hope!) Help with my PFR-3

Hello, friends!

Well, I managed to take building the PFR-3 to the end! =) Yey!

But, I need some info, if you please could help!

1. By the time I was in Part 2, I didn't have access to an antenna for moving reasons. So, I couldn't do all the calibration process. The question is: If I try to do it with the PFR-3 complete, when in calibration mode, will the TX put out any power? I'm afraid my antenna is not tuned and something could be damaged.

2. One last thing to complete the building: T3. As the wires were missing, I bought them myself. The wire used to Wind T3 is regular #24 or magnet Wire? I have both, but want to go on the correct one!

Thank you very much!

Regards

Felipe

The sun is up, and the sky is blue, no wind, and Gentlemen, it is a great day for a FoxHunt!!

So.. here's the plan, if you would like to be a FOX this summer season... then zip over to http://www.qrpfoxhunt/org
and grap an app, fill it out and ship it.. quickly. The sooner that is all done, the quicker we can get to the fun at hand.
And the sly fox, won't get past us.
It is a blast, and great practice, wonderful way to get the butterflies all riled up, no matter how many times you have been,
or, are so seasoned that nothing wakes up your butterfiles? Come try being a FOX, in the 20 acre woods.
This has been described as the training grounds for the winter hunts... maybe? Could be, it is only 20 acres.
On the other hand, 20 has been waking up, and with the great band openings, a FOX could be pretty worn out, at the end of 90 minutes
of the most fun available, well.. with your clothes on at least.
So... get those radios dusted off... and batteries charged up, put your FOX app in, and let's getter ready to GO... The summer is slipping away...

Hello everyone
Who can tell me if he bought a kit PFR3 short time ago and received the package?
And also if someone has just finished building a PFR3 recent weeks.
I would like to know also if you have any answers to emails you send to Doug Hendricks?
Good day to all
Jean Paul F6DDV

Halo Jean Paul!
My expirience och Doug is that he is not good when it comes to long replys to emails. However i can say that he answered promtly to my question, then it toke a while to get the part i neded the same as with the kit. I must say though its a good radio so is the outher kits i did buy from him.

I have been working the radio on internal battery for some 20 minutes yesterday.
all of a sudden it said POP in my ears and i saw that the display was blank but a decimal dot betwen the two last digits of the display.
As i did restart the set it went on as usual but, when i did key it it did put out power and the display started to ficker with the keying.
AHA Bad battery. 10 V on reseive and just over 9 in transmitt. with a 12V supply the same sympton.
I did measure the voltage on pin 1 on the processor DIL chip. On reseive 4,99V on tranmit it raised to about 6,5 - 7 V
I guess i will start with replacing the 5V regulator.

As i have not run the same measument befor the break down i dont know if this is normal, i don´t beleve it is.

Is there any one that have got the same problem oad / or any ideá on the subjekt.

Hi Mike
I understand what you are telling me
I wanted to get some technical information before ordering the kit.
And whether the kit is available PFR3, and I wrote to the company, I have not written directly to Doug,
and I think he is not alone to do the job? and that another person might answer may be, but I did not reply to several emails for a while.
Can I order the PFR3 if I know that the controls work well at the moment, it was just my question.
I wrote: Doug Hendricks, because I do not know the other people on the team.

Hello Christer,

To me, your symptoms almost sound like an RF feedback problem. Have you tried operating the radio into a good, 50 Ohm dummy load to see if it does the same thing? If it does, only then would I recommend replacing the 78L05.

Best of luck with the trouble shooting.

Mike,

You are correct. Doug teaches high school (senior biology, I believe) and is a Varsity Basketball coach.

His Seniors graduate tomorrow, Thursday, June 02 so I'll bet he's quite busy.

The good news is that Doug is also "graduating"; he will retire following the end of the current semester. My bet is that he won't slow down at all, probably the opposite.

I have the PRR 3 revision B and it is not the most current design. I am not certain what changes were made but if you look at the revision b instructions
on the website it will show you what I built. I am not certain but I think there
were some changes in firmware since I built mine. I believe the only difference
with mine and the earlier model was firmware on the chip.

Mike KD5KXF

PS Jean, I was misinterpreting controls in your post, I thought you meant for
vfo and antenna tuner. The kit is very complete.

There are only two different models of PFR; the PFR3 and PFR3A.

Don't confuse model numbers with instruction manual revisions.

The "REV B" and "REV B.2" manuals are revised manuals for the PFR3 (no suffix), not a reference to a new model.

Jean Paul,

I bought one the other day, don't know yet whether (or *if*) I'll receive it,
but if I do I'll let you know.

> I would like to know also if you have any answers to emails you send to Doug Hendricks?

I did get answers to my emails to him, but it took a lot of effort and I had
to get nervous about it. It looks like this is a busy time for Doug, I hope
he will be able to react more timely as soon as the school year is over.
I must add that when Doug finally did reply he was kind and supportive, but
I know emailing with him can be stressful.

good luck,
de Carlo, IZ4KBS

Bob and others,

My previous comment re changes in the PFR3A (B) are the same. I was referring to the A model as I had bought one of Dougs' first run of PFR3s. No circuit change. Just board changes to make the kit easier to build, per Doug himself at FDIM.

Great kit. Worked well from the beginning. I had a neighbor, K9JP, build mine and other than a part or two missing he had no problem and I love it. Main problem is not enough time to play with all the QRP and QRPp radios I haved collected. Two more years to retirement. Then 50% Honeydooooo 50% radio..... it was in the marriage contract under the fine print.

Hi Dale and Steve !
Thank you both for your comments. i vill check with a short lead to my 50ohm dummy load. When the misshap did hapen I was connected to my main vertical via a tuner and connected to the pfr3 BNC output.
i worked on 30m and the SWR is about 1,7/1 with the tuner on bypass.
So I will measure the current drain during TX using my dummy load. when i did the voltage test i was connectd to the antenna.
I will post a note when this is done
Thanks again and best 73 de SM4LRA/ Christer

Hi Christer,
 I may have missed this but are you tx into a dummy load? Or an antenna? If it is an antenna, then maybe the finals didn't like the match?
Or were you, are you using the tuner too? Can you put a milliameter to measure the current during tx?

It seems there us a large current drain, during tx.
 Or, if you were working on the circuitry, it may very well be the regulator as Steve suggested.

Let us know how it goes, always a challange.
Have a great day,

Hello Christer,

To me, your symptoms almost sound like an RF feedback problem. Have you tried operating the radio into a good, 50 Ohm dummy load to see if it does the same thing? If it does, only then would I recommend replacing the 78L05.

Best of luck with the trouble shooting.

73.......Steve Smith WB6TNL

I have been working the radio on internal battery for some 20 minutes yesterday. all of a sudden it said POP in my ears and i saw that the display was blank but a decimal dot betwen the two last digits of the display.
As i did restart the set it went on as usual but, when i did key it it did put out power and the display started to ficker with the keying.
AHA Bad battery. 10 V on reseive and just over 9 in transmitt. with a 12V supply the same sympton.

I did measure the voltage on pin 1 on the processor DIL chip. On reseive 4,99V on tranmit it raised to about 6,5 - 7 V
I guess i will start with replacing the 5V regulator.

As i have not run the same measument befor the break down i dont know if this is normal, i don´t beleve it is.

Is there any one that have got the same problem oad / or any ideá on the subjekt.

Hello everyone
I finally realized (finally) that Doug was QSY in Dayton, I think a lot of responsible businesses in America are low,
I also read NuePsk boss and some others.
I think this is a very important meeting of the year?
I apologize if I have too many questions too precise for information before buying pfr3, but it is not easy to see in France that you guys have left the company in one fell swoop ... H.I.
I'll wait a bit, because there are options for transportation that are important to me (some carriers are taking a lot of money for nothing, and I'm not interested in express shipping)
I also wanted to know about food, it is possible to put more than 12 volts without problem, the batteries do not interest me,
I always pack with external. Maybe add a MOS switching regulator for safety and an audio amplifier with speaker
Small double paddle and finished ... damage, it will make ...
I had a problem with the letters to place on some kits,
I think I realized that once again the yellow coffert you must deposit the letters ...
Anxiety ... H.I.
Unless I pay for Doug to do it ...

Mike,

You are correct. Doug teaches high school (senior biology, I believe) and is a Varsity Basketball coach.

His Seniors graduate tomorrow, Thursday, June 02 so I'll bet he's quite busy.

The good news is that Doug is also "graduating"; he will retire following the end of the current semester. My bet is that he won't slow down at all, probably the opposite.

73.......Steve Smith WB6TNL

From: Mike Malone <kd5kxf@...>

Doug can be tough to reach the week after Dayton... like most of us he has a civilian life outside of ham radio. He has always come through on my orders or anything else needed.

I have the PRR 3 revision B and it is not the most current design. I am not certain what changes were made but if you look at the revision b instructions on the website it will show you what I built. I am not certain but I think there were some changes in firmware since I built mine. I believe the only difference with mine and the earlier model was firmware on the chip.

Mike KD5KXF

PS Jean, I was misinterpreting controls in your post, I thought you meant for vfo and antenna tuner. The kit is very complete.

Hi Carlo
Yes, I think I understand ...
I will be patient and I think I have already obtained valuable intelligence from the mailing list.
Certainly it is difficult to know everything and understand everything at once.
However some points I must await the return of Doug and do not rush me stupidly in case something
should be changed to the order or delivery, or add options.
It is always possible to get what one wants, but not going too fast, it's never good.
Sometimes, I learned it is better to pay a little more if needed to be satisfied,
instead of rushing and having to reorder, but we can also talk with the vendor ...

Jean Paul,

I bought one the other day, don't know yet whether (or *if*) I'll receive it,
but if I do I'll let you know.

> I would like to know also if you have any answers to emails you send to Doug Hendricks?

I did get answers to my emails to him, but it took a lot of effort and I had
to get nervous about it. It looks like this is a busy time for Doug, I hope
he will be able to react more timely as soon as the school year is over.
I must add that when Doug finally did reply he was kind and supportive, but
I know emailing with him can be stressful.

good luck,

The sun is up, and the sky is blue, no wind, and Gentlemen, it is a great day for a FoxHunt!!

So.. here's the plan, if you would like to be a FOX this summer season... then zip over to http://www.qrpfoxhunt.org
and grap an app, fill it out and ship it.. quickly. The sooner that is all done, the quicker we can get to the fun at hand.
And the sly fox, won't get past us.
It is a blast, and great practice, wonderful way to get the butterflies all riled up, no matter how many times you have been,
or, are so seasoned that nothing wakes up your butterfiles? Come try being a FOX, in the 20 acre woods.
This has been described as the training grounds for the winter hunts... maybe? Could be, it is only 20 acres.
On the other hand, 20 has been waking up, and with the great band openings, a FOX could be pretty worn out, at the end of 90 minutes
of the most fun available, well.. with your clothes on at least.
So... get those radios dusted off... and batteries charged up, put your FOX app in, and let's getter ready to GO... The summer is slipping away...

Hay Guys,

Give the guy a break. He just did Dayton which takes weeks to prepare for, then weeks to recover and catch up. These guys hand pack these kits. It takes time and patience. Every one of these kits is a gem and worth the wait. I bought my PFR-3A kit last year at Dayton. It was short two small parts. I sent an email to Doug, then started the kit. The parts arrived before I really needed them. This is one fantastic QRP transceiver.

Dale,
I have the right to express my feelings about the lack of communications from the Hendricks kits.
If a Man takes on more then he can handle and has no time to process orders them post an announcement on the site where the kits are being sold.
Then everyone knows whats going on.
It's that simple.
Dave Benson does that.
As far as the pfr3 rig goes, it is the design of Steve Weber.
Steve,
THANK YOU for designing what must be the almost perfect,affordable QRP 3 band rig.
I built the Red Hots, both the 20 & 40 meter versions,Several NC-20 rigs,NC-40-A,SST's,but when it comes to receiver sensitivity,selectivity,your pfr3 beats the rest.
I just may buy a back up when shipments start again.
I took a peek and it looks like something I can build.
Just need stronger glasses:-)

To beat the subject a bit more:

The QRP kits do take 10 days or so to ship out; he does not claim overnight shipping. Well worth the wait

Mr Hendricks makes it clear that he will make sure that you have the correct parts, and he did that for me quite promptly.

He also makes it clear that he does not handle repair or detailed tech questions, those go to Mr Weber, Mr Tayloe, or a few others.

Some have said the instructions are lacking. They just have to be kidding. The few problem areas have been addressed well here, just do a search.

The days of Heathkits are gone. (and these kits are not $$$$ like Elecraft)

So your point?
Who are you addressing this to?
BTW,
Some builders on the Elcraft list will build this rig for those who can't
and the disabled.
It may not be the $$$$$$$ Elcraft rig but from what I read about Elcraft
rigs,they have their bugs,especially the 4 band K-1.
Steve proved you don't need a $$$$$$ kit for top performance.

I have purchased many items from Doug Hendrix over the years. Here are my observations. Some of them are not politically correct but every thing is true based on my observations:
1. He sells great kits with few exceptions.
2. He is an honest person. Sometimes he is slow but he will always get you you radio and or any missing parts.
3. Yes, he has his favorite persons and they do get preferential treatment.
4. Doug wants to be the leader and in most cases does a good job of it. However, he is no design engineer or great technician. All his kits are backed up by the designer of the rig or there is help from groups/reflectors for the item.
5. Prices are fair and reflect a modest profit for the seller and designer. (He won't get rich with his modest profits).
6. If you really want one of his kits, the wait will be worth it. (Many kits are shipped on a timely basis with little wait).
7. He could do a better job letting potential customer's know of rig changes, such as silk screening to water decals, rig changes, and waiting periods, etc.
8. He could do a better job answering his e-mail. He wishes the customers would understand his time restraints but he has little apathy for the buyers time restraints.
9. He is a busy guy teaching school and making hamfests plus family commitments. (I think it is great he makes many ham fests. Not every seller would do this).
10. His wife, I am sure is taking a lot of his time. Without going into details, it's my understanding she is seriously very sick. I am sure he doesn't want to talk about this with the general public and it's a private matter.
11. Hopefully, when Doug retires this year, he will be able to correct some of his weak points.
The bottom line is, Doug sells very nice kits and he will get it to you if you buy one and he will make good any missing parts. The kits are fairly priced and the manuals are better then any Heathkit manual. They have color build sheets, high resolution pictures, build instructions, high quality shadow masked double sided glass boards, test sequences, diagrams, close up shots, great coil winding instructions, parts lists and schematic diagrams. I can't imagine having better instructions for any kit being offered. I am not the biggest fan of slide on decals over silk screening, but I am sure the decals keep costs down and if applied correctly do give a nice look to the cabinet.
These are the honest things that come to mind over my dealings with Doug Hendrix (QRP Kits) over many years.

Hi Steve and Dale!
Did my testing on my dumy load and my troubbles developed further.
The reseiver works well and every other funktion on the four buttons like up and down rit and so on but, when i did key down the sidetone rise for about two seconds and then the radio simly shut down.
As its still in the case just did few measuments . when i started it up again the RX works again and the 5 V regulator turns out 5V. then when i hit the key the thing turns of instantly and the regulator givs some 3,8V and holding. It is reset by cuting the power. The input on the regulator drops slightly from 10.17 to 10V.
It Puzzels me what can draw so much current after the stabilizer. next get it out of the case .

Hello Christer,

To me, your symptoms almost sound like an RF feedback problem. Have you tried operating the radio into a good, 50 Ohm dummy load to see if it does the same thing? If it does, only then would I recommend replacing the 78L05.

Best of luck with the trouble shooting.

73.......Steve Smith WB6TNL

I have been working the radio on internal battery for some 20 minutes yesterday.
all of a sudden it said POP in my ears and i saw that the display was blank but a decimal dot betwen the two last digits of the display.
As i did restart the set it went on as usual but, when i did key it it did put out power and the display started to ficker with the keying.
AHA Bad battery. 10 V on reseive and just over 9 in transmitt. with a 12V supply the same sympton.
I did measure the voltage on pin 1 on the processor DIL chip. On reseive 4,99V on tranmit it raised to about 6,5 - 7 V
I guess i will start with replacing the 5V regulator.

As i have not run the same measument befor the break down i dont know if this is normal, i don´t beleve it is.

Is there any one that have got the same problem oad / or any ideá on the subjekt.

==========
I have purchased many items from Doug Hendrix over the years. Here are my observations. Some of them are not politically correct but every thing is true based on my observations:

1. He sells great kits with few exceptions.

2. He is an honest person. Sometimes he is slow but he will always get you you radio and or any missing parts.

3. Yes, he has his favorite persons and they do get preferential treatment.

4. Doug wants to be the leader and in most cases does a good job of it. However, he is no design engineer or great technician. All his kits are backed up by the designer of the rig or there is help from groups/reflectors for the item.

5. Prices are fair and reflect a modest profit for the seller and designer. (He won’t get rich with his modest profits).

6. If you really want one of his kits, the wait will be worth it. (Many kits are shipped on a timely basis with little wait).

7. He could do a better job letting potential customer’s know of rig changes, such as silk screening to water decals, rig changes, and waiting periods, etc.

8. He could do a better job answering his e-mail. He wishes the customers would understand his time restraints but he has little apathy for the buyers time restraints.

9. He is a busy guy teaching school and making hamfests plus family commitments. (I think it is great he makes many ham fests. Not every seller would do this).

10. His wife, I am sure is taking a lot of his time. Without going into details, it’s my understanding she is seriously very sick. I am sure he doesn’t want to talk about this with the general public and it’s a private matter.

11. Hopefully, when Doug retires this year, he will be able to correct some of his weak points.

The bottom line is, Doug sells very nice kits and he will get it to you if you buy one and he will make good any missing parts. The kits are fairly priced and the manuals are better then any Heathkit manual. They have color build sheets, high resolution pictures, build instructions, high quality shadow masked double sided glass boards, test sequences, diagrams, close up shots, great coil winding instructions, parts lists and schematic diagrams. I can’t imagine having better instructions for any kit being offered. I am not the biggest fan of slide on decals over silk screening, but I am sure the decals keep costs down and if applied correctly do give a nice look to the cabinet.

These are the honest things that come to mind over my dealings with Doug Hendrix (QRP Kits) over many years.

Jean Paul,

I'm afraid Hendricks is just not someone who understands how important it is to communicate with his customers. I find it in very poor taste that he apparently never even sends a quick note about the status of a request. I bought the PFR-3A and Weber Dual Bander from QRPKITS and have had no response or very long delays in receiving parts for both kits. As a first time builder (PFR-3A), I also had a few very simple questions regarding identification of parts received and never got a response. I'm still waiting (over 5 months now) for some kind of response regarding missing parts on the WBD. I can only suggest you keep sending him messages about your problem. Technical difficulties are best dealt with on this user's group.

Best of luck and 73,
Peter - KB1PBA

Yes, Steve was referring to the regulator. But before you swap it, maybe a check on the output of the regulator would give more information?
I think it is U5 on some of the schematics, and mislabeled on others as U9... Or correctly labeled for that particular radio version.
The Q7-9 should be the finals, those would be the ones that I was considering possibly being shorted... and a check with an ohmmeter, would tell that, in circuit.

As a person who has a family, and a job, and also sells small kits (http://www.dougswordclock.com) - I can understand both sides, but I have to emphasise how important it is to keep people in the loop.

I have small stock levels - (This isn't my day job), and occasionally I run out - then I have to wait a week or two for new stocks to arrive before I can kit up. I used to be really embarrased about it, and try to not tell people that I stuffed up, but that only caused people to worry that they sent money into a big hole.

Now I keep people in the loop, and I find that on the whole they are happier.

Regarding helping people out - I have structured my day into two blocks of time devoted to responding to peoples emails - 7-7.30 in the morning, and 6-6.30 at night - That way I can remain responsive to peoples questions (and actively help them faultfind remotely if needed), and it causes me less stress. I had to get my family to understand the need for the time though - initially, I was seen as 'goofing off at the computer' and it was disruptive - not there is an defined understanding and it is easier.

Balancing all of the competing priorities is tricky.

All of that said, When I ordered my kit (and subsequently a set of poly variable caps), there was not a lot of fedback, but things arrived within a reasonable period. this forum is the *best* place for problem rectification though!

Hi Peter
My head is too hard, and I do not always understand the translation ...
But after a while, after talking with friends on the list, I think I understood it right, it's useless to harass Doug
with technical issues, doug is the boss of the company but his specialty is not 100% technique and responses to problems.
I read it must ask the technical support and more specifically to one who invented the pfr3 is clearly marked, Steve Weber KD1JV.
Or some of the OMs list or the employee who is specialized to respond to technical problems.
Tell me if, here, from France, I understand or not?

Yes, you understand, JP, very well.
Every radio has its good points, and some radios have some not so good features.
And sometimes is very much if you like one or the other.
For me, it isn't a big difference, however, I prefer KD1JV designs.
I've said that if a builder has a problem with a KD1JV design, like the AT series, or the PFR3, I'll repair it, or finish building it, or simply build it, if the owner can't. And this extends to
the Elecraft radios too. If the owner can't - handicapped or simply can't.. I'll build/repair the radio for free. They just get to pay the shipping.
We, the amateur radio community, have such good radios available as kits, that do such a good job, that no one should be lacking of having one, if they want one enough to buy it.
Have a great day,

Hi Peter
My head is too hard, and I do not always understand the translation ...
But after a while, after talking with friends on the list, I think I understood it right, it's useless to harass Doug
with technical issues, doug is the boss of the company but his specialty is not 100% technique and responses to problems.
I read it must ask the technical support and more specifically to one who invented the pfr3 is clearly marked, Steve Weber KD1JV.
Or some of the OMs list or the employee who is specialized to respond to technical problems.
Tell me if, here, from France, I understand or not?

Jean Paul,

I'm afraid Hendricks is just not someone who understands how important it is to communicate with his customers. I find it in very poor taste that he apparently never even sends a quick note about the status of a request. I bought the PFR-3A and Weber Dual Bander from QRPKITS and have had no response or very long delays in receiving parts for both kits. As a

first time builder (PFR-3A), I also had a few very simple questions regarding identification of parts received and never got a response. I'm still waiting (over 5 months now) for some kind of response regarding missing parts on the WBD. I can only suggest you keep sending him messages about your problem. Technical difficulties are best dealt with on this user's group.

Best of luck and 73,
Peter - KB1PBA

Hi John, and others,
If the delay or lack of perceived customer service is causing a problem, let me offer another alternative, If you want this kit, and are prepared to buy it, contact me directly, and arrangements will be made. If you are building it for the first time, then you don't need to be worried about if you will get it or not. IF you can't build it, then I will, and you'll get a finished radio, professionally built, and spec'd with standards traceable to NIST.
Don't let what someone has perceived, cause you to be without a good radio.

I would not let that fear sway you John. This forum group is a great source
of
technical assistance and the designer himself (Steve KD1JV) is very
responsive
as well. I don't know I would recommend this rig for a first project
though. I would
consider something simpler. Ham Can from 4 States QRP is a simple
transceiver
that would teach you all the basic skills necessary to build this. Or maybe
one
of the QRP-ME kits. The PFR 3 is a very high performance for the buck rig,
I
would not throw it out of consideration.

Just a bit from me.. I was at Dayton and was able to spend some time talking to Doug. I could not have been happier with my experience. He walked me through a few questions about construction technique and I am happy to say a very helpful guy.
My experience with orders from all my kits has never been the same as ordering from HRO and getting next day delivery. I don't expect that, knowing most everyone is doing this as a hobby business. But there are plenty of folks around here more than willing to lend a hand. Go ahead and give it a try, I'm enjoying mine. No reason you shouldn't either.

Hi:

Been reading this thread with interest. I actually was in the same boat when I ordered mine. New ham (3 years into the hobby after being out of it for 30 years), little build experience (again, rusty) and no parts bin to speak of.

I bought the PFR-3A as an opportunity to resharpen my skills and when there were a few parts missing, restock my parts bins. I took a lot of time building this. Made sure everything went well and used this forum to understand issues and answer my questions.

I can happily say things worked out great. This kit brought me into QRP, got my kit building skills re-honed, torroid winding skills started and helped to supply my parts bin. I totally can understand a busy schedule. I honestly feel that if a part is missing from a kit and it is something you can readily get, hey, go out and get one if you can. Get 2 and have one as a spare.

Thanks to all for your help just from posting to this forum and thanks to Steve and Doug and all the others behind QRPKits.

Hello John,

Well, that's a shame because you will be missing out on a wonderful radio. There is more than enough of a support system in this Group to help with most any problem notwithstanding possible any potential communication problems with QRPKits.

If you've had success in the past assembling electronic kits with through-hole parts and toroidal inductors then I would expect you'd have no problems successfully assembling a PFR3A.

Hello everyone
I think we should calm down and think that a person can not do more work than 12 hours per day.
It also needs lots of quiet, if health does not go well.
I think I already answered this.
I only asked a question about who has already ordered by what happens later
but I have never been criticism against the seller or its employees.
I think it is very clear.
Now, I had answers, and my reaction was to order the prf3, and without knowing how long I waited, so it means I confience.
Other problems other than technical and joke a bit are not interesting, I think so

2436. wonderful radio, have patience

Yahoo group: pfr3_group
Date: 2011-06-03 18:42:14 UTC
From: lahagar1@aol.com
Topic: 2383 Message: 2436

John, and others:

My PFR-3A kit had missing and incorrect parts. Yes, it took longer to procure all the parts than I had expected, but Doug replied to my requests and supplied every part needed.

In my opinion, any parts delay is entirely inconsequential when compared to this little gem of a radio kit!

The PFR-3A was very fun and easy to build. It is a solid PLL VFO performer. There is virtually no alignment needed. It has a GREAT built-in ATU and an internal keyer. It runs for hours on 8 AA batteries and is sold at a very reasonable price for a 3-band transceiver!

It's a wonderful radio, have patience and you will be rewarded with a kit building experience you will treasure forever, and a fine Steven Weber designed QRP rig to boot!

See you guys on 40/30/20 this weekend!!

2437. PFR3 Kit

Yahoo group: pfr3_group
Date: 2011-06-04 05:53:36 UTC
From: lee
Topic: 2383 Message: 2437

A friend of mine got me to order and build a PFR3 for him. (I don’t own one myself, but wish I did own one). (I ordered the kit from QRP Kits, yesterday. Of course I have not yet received it.
Having some free time this evening I decided to download the manual which shows it was last updated 3/01/2010. (That’s over a year ago). I decided then to familiarize myself with the manual which I then did. After that, I decided to look over the PARTS LIST. Having looked at it, it struck me odd the list does list the hardware but no mention of a case (top or bottom or the screws holding the top and bottom). It has no mention of the two sets of decals which I have heard are within the kit and there is no mention of the two battery holders which are described in the manual as to how they are installed. Why is this?
After realizing the above, I started to question what else should be on this PARTS LIST which are not included? I would think the kit has been out long enough to be more accurate then this and everything within a kit should be listed on the PARTS LIST. Am I the first person noticing these errors? It bothers me, as I plan to check all the parts prior to the build for any missing parts. I now don’t feel comfortable the PARTS LIST is accurate. What else should be listed on the PARTS LIST which are not on the list?
That said, the manual does otherwise look good.

Lee,
The radio only has 1 set of battery holders.
It holds 8 AA size batteries.
Not enough room to get another 8 AA holder inside.
I always use a 5 amp external battery for longer 5 watt output so i'm not to worried about the internal pack.
I use those for listening.

The manual tells you to mount BOTH battery holders which hold 4 batteries each and then they are wired in series to give you 12 volts using 8 batteries. (4 batteries in each of the two holders). I consider a “set” to mean two battery holders. My problem is not with the holders, but the fact they are not listed on the PARTS MANUAL making the list inaccurate.

Lee,
I have a battery holder that holds 8 AA cells.
But don't worry about it because I have 3 FT 817 rigs,2 FT 857D rigs and an IC 7000
Even my new HT the manual has errors
I went nuts trying to program on rig only to find that the manual never said 1 button had to be held in for at least 2 seconds.
No one else has a problem so wait until the kit arrives and any questions will be answered here.

Hi Dale !
I´m not to familiar with FET transistors but I did a check with an ohm meter. First with with one leed connected to minus och the external power jack and then directly over the devises testing both ways ithe the ohm meter, the results were about the same. To ground : drain abt. 280ohms, Sourse 0 Ohms. and Gate 1,5 ohms.
The resistance on the gate looks a bit low to me but could the output of U8 produce such a result?
and 280 ohm on the drain ?? Do please comment on that. And there is of course the diod D7 that could be broken but then it should be about 0 ohms over it.
I wait for your comment before i warm up the soldering iron.

Yes, Steve was referring to the regulator. But before you swap it, maybe a check on the output of the regulator would give more information?
I think it is U5 on some of the schematics, and mislabeled on others as U9... Or correctly labeled for that particular radio version.
  The Q7-9 should be the finals, those would be the ones that I was considering possibly being shorted... and a check with an ohmmeter, would tell that, in circuit.

Halo Steve !
I must check onse again. U9 you said, I supouse you are talking about the regulator U5 78L05. I cant find any U9 even if there is higher U numbers on the board or is it apossibility that you did mean the Q9 in the group of three devises named Q7 to 9. i dont think you do i still have to ask so i dont miss any thing.

Best regards Christer

Hello Christer,

I suspect a defective 78L05 regulator, U9. If the finals were shorted, I would expect that the input to U9 would pull down lower than 10 Volts. 10 Volts is plenty of overhead for U9 to function properly.

Having said that, Dale probably has more experience with the PFR3 than anyone except Steve Weber so, as he says, "It will be interesting to see as this unfolds".

Best of luck with your troubleshooting.

Hi Steve and Dale!
Did my testing on my dumy load and my troubbles developed further.
The reseiver works well and every other funktion on the four buttons like up and down rit and so on but, when i did key down the sidetone rise for about two seconds and then the radio simly shut down.
As its still in the case just did few measuments . when i started it up again the RX works again and the 5 V regulator turns out 5V. then when i hit the key the thing turns of instantly and the regulator givs some 3,8V and holding. It is reset by cuting the power. The input on the regulator drops slightly from 10.17 to 10V.
It Puzzels me what can draw so much current after the stabilizer. next get it out of the case .

Hello friends list
An idea:
I have used batteries for many years flying model of 5 amps LiPo cells in 3 and 4
(4, only the HB-1A supports, no one else wants 18v!)
I must find a solution MOS switching regulator that does not heat the pfr3 that does not support more than 12 volts, it concerns me greatly that problem a little embarrassing.
Instead of 1.2 V NiMH cells that do not keep their proper volts, I get cell LiIon pack 3 v PC and 3 packs of 3 V in series of 2200 mA / hr are good for many hours Traffic on Small TRX Deca. and also in the MFJ antenna analyzer.
But you need a special charger, attention is very dangerous, it could explode ... (use a special charger, nothing else!) but otherwise the load remains well and they are very effective, they must sort out and control them in the battery packs PC declared defective, but half are still often very good, and this without spending money.
Some chargers for rechargeable batteries which are all aero model with built cheap in China or elsewhere.
I am very happy with this choice, and I do not want cell NIMH who are worse than the old NICD.

Lee,
The radio only has 1 set of battery holders.
It holds 8 AA size batteries.
Not enough room to get another 8 AA holder inside.
I always use a 5 amp external battery for longer 5 watt output so i'm not to worried about the internal pack.
I use those for listening.

Subject: RE: [pfr3_group] PFR3 troubble.

Hello Christer,

I suspect a defective 78L05 regulator, U9. If the finals were shorted, I would expect that the input to U9 would pull down lower than 10 Volts. 10 Volts is plenty of overhead for U9 to function properly.

Having said that, Dale probably has more experience with the PFR3 than anyone except Steve Weber so, as he says, "It will be interesting to see as this unfolds".

Best of luck with your troubleshooting.

Hi Steve and Dale!
Did my testing on my dumy load and my troubbles developed further.
The reseiver works well and every other funktion on the four buttons like up and down rit and so on but, when i did key down the sidetone rise for about two seconds and then the radio simly shut down.
As its still in the case just did few measuments . when i started it up again the RX works again and the 5 V regulator turns out 5V. then when i hit the key the thing turns of instantly and the regulator givs some 3,8V and holding. It is reset by cuting the power. The input on the regulator drops slightly from 10.17 to 10V.
It Puzzels me what can draw so much current after the stabilizer. next get it out of the case .

Hi Lee,

You won't have any problem. The 3/1/10 instructions for the 3A are very clear. I think the only other part that might not be on the list is the DPDT antenna toggle switch. The battery holder, page 16, and DPDT antenna switch p.15 are installed without any drama. I think every other part was on the list. Anyway, all parts including the case, its screws, the battery holder and that toggle switch are clearly explained in the directions. Here is my video record of the complete kit building process:

1) INVENTORY : Probably goes without saying, but the first thing one should do when beginning the kit is segregating and identifying every part.
http://www.youtube.com/watch?v=0y5LtFsCdhs

2) RECEIVER ASSEMBLY: when assembling, I recommend marking each one in the sequence of parts installation with a highlighter as it is installed. I also made an 11x17 enlargement of the placement diagram (page 4) and highlighted each one as I installed it.
http://www.youtube.com/watch?v=2aZYegVjMhI&feature=watch_response

3) TRANSMITTER ASSEMBLY: You will find this kit very well documented and easy to build.
http://www.youtube.com/watch?v=wJs2iYGd-VA

4) OPERATION: I found that simply following the instrcutions resulted in a fun to use QRP transceiver! Here is the first QSO after I finished the kit:
http://www.youtube.com/watch?v=hUJiK9eQ0K0&feature=related

Have fun building this wonderful kit, and let us all know how it goes for you!

Subject: [pfr3_group] PFR3 Kit

A friend of mine got me to order and build a PFR3 for him. (I don’t own one myself, but wish I did own one). (I ordered the kit from QRP Kits, yesterday. Of course I have not yet received it.

Having some free time this evening I decided to download the manual which shows it was last updated 3/01/2010. (That’s over a year ago). I decided then to familiarize myself with the manual which I then did. After that, I decided to look over the PARTS LIST. Having looked at it, it struck me odd the list does list the hardware but no mention of a case (top or bottom or the screws holding the top and bottom). It has no mention of the two sets of decals which I have heard are within the kit and there is no mention of the two battery

holders which are described in the manual as to how they are installed. Why is this?

After realizing the above, I started to question what else should be on this PARTS LIST which are not included? I would think the kit has been out long enough to be more accurate then this and everything within a kit should be listed on the PARTS LIST. Am I the first person noticing these errors? It bothers me, as I plan to check all the parts prior to the build for any missing parts. I now don’t feel comfortable the PARTS LIST is accurate. What else should be listed on the PARTS LIST which are not on the list?

That said, the manual does otherwise look good.

It's a real kit, it requires some skill and knowledge to complete it successfully. Still, not what you could call a 'hard' kit. The design is a proven one. That single conversion superhet is a hot receiver. There are plenty of 'experts' here who will do everything to help the newbie, up to and including building the darn thing for them!

If money wasn't tight I'd get one myself, but finances and a lack of time to do the mountain topping I have in mind are holding me off. I hope it stays in production for a while. :)

Plus, remember, guys, that the big ham radio companies (except for Ten Tec) can't really be bothered with low cost QRP kits, so the price for their abandonment of that sector is having to deal with small companies with low overhead and small staff willing to take the time and trouble (probably with not a huge profit margin) to make and pack these wonderful kits for those of us not knowledgeable or ambitious enough to build one from scratch.

We should all be doing everything to encourage these efforts. I know customer relations may get the short end of the stick in these basement operations, but let's just take these things with some humor, good will, and in the spirit of camaraderie, ok?

Hi Dale !
I´m not to familiar with FET transistors but I did a check with an ohm meter. First with with one leed connected to minus och the external power jack and then directly over the devises testing both ways ithe the ohm meter, the results were about the same. To ground : drain abt. 280ohms, Sourse 0 Ohms. and Gate 1,5 ohms.
The resistance on the gate looks a bit low to me but could the output of U8 produce such a result?
and 280 ohm on the drain ?? Do please comment on that. And there is of course the diod D7 that could be broken but then it should be about 0 ohms over it.
I wait for your comment before i warm up the soldering iron.

2454. PFR3 and Solar power

Yahoo group: pfr3_group
Date: 2011-06-05 05:04:40 UTC
From: lee
Topic: 2383 Message: 2454

I know a lot of you guys have probably done this but I have not. That is, it would be great to maybe have a 7 amp 12 volt gel cell being charged by a 10 watt solar panel and controller, thus running the PFR-3A totally off of solar power. I'm not a "take it to the field guy", but I guess you could do this too. It just seems like the power draw of a PFR-3 would be perfect with a 7 amp gel cell, and a 10 watt solar panel with controller when you consider receive vs transmit times. The combination of the above 4 items seems like a good match to me. It would be hard to run out of power this way, the way I operate.
I see QRP Kits sells a Dan Tayloe Battery Status Indicator kit BSI for $15.00. This might be a great addition to the above.

Lee,
I have that in my rig but this one never changes color even when battery power is only giving me just under 1 watt.
Another disadvantage is that I have a nice perfect size case with a snap on top.
I wrap the rig in a nice soft cloth but that push button on the side gets pushed in when the case is on it's side and the light stays on.
Some times just wrapping that soft cloth to tight will hold the button in.
A small slide switch would have been better or mount the button on top of the rig where all other things are mounted.
I really can live without is since I only use a nice small 4 AMP Jell type battery that will give me 5 watts all day long.

OK, Bob. I see the Tayloe Battery Indicator is adjustable for the three color voltage settings. Maybe you need to adjust your unit so this works. OK on other stuff. I have used a 7 amp 12 volt Gel Cell for years. In fact I replaced then one I was using recently. The old one was used on my QRP rigs for years. I bought an automatic smart 1 1/2 amp charger from Wall Mart I use to keep it “topped off”. It seems to work great. Howver, I’d rather charge the thing with solar power. I am thinking of doing this soon.

Hi Lynn

This page really well with a group of useful shortcuts.
I do not know whether it existed or if you built it, but it would be good, that the seller in the same way
a very complete with videos and detailed pictures, even if made by buyers took the time to take pictures at each stage of construction.
It's a big job that needs patience, a big thank you because many people build kits perfectly but do not take time for friends.
And the person, like you, who gathers the information needed a page to be thanked in the same way.
I put a lot of years to realize myself that my small accomplishments with pictures at each stage could be very valuable.
To do this it took me to see me even videos of people who will make expeditions, which explain and also build kits or antennas.
This is a priceless is exactly what drives a ham radio a bit "sleepy" to start in testing and construction.

Subject: [pfr3_group] PFR3 Kit

A friend of mine got me to order and build a PFR3 for him. (I don’t own one myself, but wish I did own one). (I ordered the kit from QRP Kits, yesterday. Of course I have not yet received it.

Having some free time this evening I decided to download the manual which shows it was last updated 3/01/2010. (That’s over a year ago). I decided then to familiarize myself with the manual which I then did. After that, I decided to look over the PARTS LIST. Having looked at it, it struck me odd the list does list the hardware but no mention of a case (top or bottom or the screws holding the top and bottom). It has no mention of the two sets of decals which I have heard are within the kit and there is no mention of the two battery holders which are described in the manual as to how they are installed. Why is this?

After realizing the above, I started to question what else should be on this PARTS LIST which are not included? I would think the kit has been out long enough to be more accurate then this and everything within a kit should be listed on the PARTS LIST. Am I the first person noticing these errors? It bothers me, as I plan to check all the parts prior to the build for any missing parts. I now don’t feel comfortable the PARTS LIST is accurate. What else should be listed on the PARTS LIST which are not on the list?

That said, the manual does otherwise look good.

Hello everyone
All this is true, I would give a board can be easy, but I also have the experience to give ...
Maybe it is good to show in a few group photos or videos, people in this business in preparation work, work PC for mail, and many other situations ...
The result of this very small loss of time is extraordinary.
I think that friends should advise Doug kindly on this, because what may seem a bit pointless film gives a good idea of the business, customers love to see OM people and place or to leave their kits.
We are far from the technique can be with what I say, but in the same way it takes a lot of photos and video montages, we also promote the people's business.
I did not invent anything about it, I just learned ...

Plus, remember, guys, that the big ham radio companies (except for Ten Tec) can't really be bothered with low cost QRP kits, so the price for their abandonment of that sector is having to deal with small companies with low overhead and small staff willing to take the time and trouble (probably with not a huge profit margin) to make and pack these wonderful kits for those of us not knowledgeable or ambitious enough to build one from scratch.

We should all be doing everything to encourage these efforts. I know customer relations may get the short end of the stick in these basement operations, but let's just take these things with some humor, good will, and in the spirit of camaraderie, ok?

Hi Lee and other friends from the list
It is interesting to give ideas, I do think that some QRP ham radio do so, but perhaps not much ... here in the western part of France the sun is well known but not as strong as the U.S. may be, but the wind is also interesting, a little wind sensor SAVONIUS such as a sheet of metal shaped "S"between two discs on a small generator volts may be interesting, too, the problem is: not so easy to transport than the solar panel.
Solar panels are still quite expensive
The problem of regulating the charging of the battery is not easy to build or own.
Is interesting for all these things put a seller's web link to friends as we found a kit or parts of interest to the QRP ham radio

Subject: [pfr3_group] PFR3 and Solar power

I know a lot of you guys have probably done this but I have not. That is, it would be great to maybe have a 7 amp 12 volt gel cell being charged by a 10 watt solar panel and controller, thus running the PFR-3A totally off of solar power. I’m not a “take it to the field guy”, but I guess you could do this too. It just seems like the power draw of a PFR-3 would be perfect with a 7 amp gel cell, and a 10 watt solar panel with controller when you consider receive vs transmit times. The combination of the above 4 items seems like a good match to me. It would be hard to run out of power this way, the way I operate.

I see QRP Kits sells a Dan Tayloe Battery Status Indicator kit BSI for $15.00. This might be a great addition to the above.

Hi Lynn

This page really well with a group of useful shortcuts.
I do not know whether it existed or if you built it, but it would be good, that the seller in the same way
a very complete with videos and detailed pictures, even if made by buyers took the time to take pictures at each stage of construction.
It's a big job that needs patience, a big thank you because many people build kits perfectly but do not take time for friends.
And the person, like you, who gathers the information needed a page to be thanked in the same way.
I put a lot of years to realize myself that my small accomplishments with pictures at each stage could be very valuable.
To do this it took me to see me even videos of people who will make expeditions, which explain and also build kits or antennas.
This is a priceless is exactly what drives a ham radio a bit "sleepy" to start in testing and construction.

Hi Lee,
You won't have any problem. The 3/1/10 instructions for the 3A are very clear. I think the only other part that might not be on the list is the DPDT antenna toggle switch. The battery holder, page 16, and DPDT antenna switch p.15 are installed without any drama. I think every other part was on the list. Anyway, all parts including the case, its screws, the battery holder and that toggle switch are clearly explained in the directions. Here is my video record of the complete kit building process:

1) INVENTORY : Probably goes without saying, but the first thing one should do when beginning the kit is segregating and identifying every part.
http://www.youtube.com/watch?v=0y5LtFsCdhs

2) RECEIVER ASSEMBLY: when assembling, I recommend marking each one in the sequence of parts installation with a highlighter as it is installed. I also made an 11x17 enlargement of the placement diagram (page 4) and highlighted each one as I installed it.
http://www.youtube.com/watch?v=2aZYegVjMhI&feature=watch_response

3) TRANSMITTER ASSEMBLY: You will find this kit very well documented and easy to build.
http://www.youtube.com/watch?v=wJs2iYGd-VA

4) OPERATION: I found that simply following the instrcutions resulted in a fun to use QRP transceiver! Here is the first QSO after I finished the kit:
http://www.youtube.com/watch?v=hUJiK9eQ0K0&feature=related

Have fun building this wonderful kit, and let us all know how it goes for you!

Hi Jean,
I don't think that device will even begin to turn a generator
I started p;aying around with the bike generator that was sort of small but
the bike had 26 inch wheels on it and I had to ride at medium speed for
decent lighting.
Just a nice slow coast only lit up the front and rear lights to a dim glow.
I think you would need 3,000 RPM to get a good voltage for charging.
I have some small DC motors here for my electric helicopters but even if
they did put out enough voltage I don't think they would last long since the
application is now making voltage and not using voltage but a few years ago
I made a very nice wind speed generator from one.
So far I have not seen a small wind driven generator.

Hello again Lynn
It is quite normal to work in this direction because everyone ends up winning this way.
It is obvious that if a professional seller sells good products but did not have time to show its goodwill and its teams to work with images, and also to explain the same way the best way to assemble and fontionne what he sells, some people just pressed will say that nothing is going right ... but it may take a little better analyze what is happening, because small businesses are often best for quality and price.
If you do not mind that we will pay more money in big companies, not necessarily the best after sales service.
It is not difficult to see as examples of small businesses licensed to sell the big sellers ... buyers often see the difference.
So it's not just being nice to help with photos and videos, is also doing the best for everyone is a winner, I think it's simple and effective, and so we reward those who really make an effort.

Hi Dale !

I get more and more puzzeled, anyway I did remove eg. cut the diod leg on the ground side and lifted it upp. One way I get infinet resistance OK. The other way around i get a couple of MOhm. Could it be burned off ? then it would not drive the curent shuting the radio down on TX.

Then to my surprice measuring on the finals i get
S 0ohm ofcourse.
G 1,4 ohm should it be so low but at least no change.
D about 60 ohms. how come ? it was about 280 before.
This i dont get . Can a Zener diod make this kind of effect?
I dont think so but still...?
Then there is the gate on the finals . shut it be sa low at 1,4ohms.
about 60 ohms on the output ?????

What do you think ?

Hi Dale !
I´m not to familiar with FET transistors but I did a check with an ohm meter.
First with with one leed connected to minus och the external power jack and then directly over the devises testing both ways ithe the ohm meter, the results were about the same. To ground : drain abt. 280ohms, Sourse 0 Ohms. and Gate 1,5 ohms.
The resistance on the gate looks a bit low to me but could the output of U8 produce such a result?
and 280 ohm on the drain ?? Do please comment on that. And there is of course the diod D7 that could be broken but then it should be about 0 ohms over it.
I wait for your comment before i warm up the soldering iron.

Yes, Steve was referring to the regulator. But before you swap it, maybe a check on the output of the regulator would give more information?
I think it is U5 on some of the schematics, and mislabeled on others as U9... Or correctly labeled for that particular radio version.
  The Q7-9 should be the finals, those would be the ones that I was considering possibly being shorted... and a check with an ohmmeter, would tell that, in circuit.

Subject: RE: [pfr3_group] PFR3 troubble.

Hello Christer,

I suspect a defective 78L05 regulator, U9. If the finals were shorted, I would expect that the input to U9 would pull down lower than 10 Volts. 10 Volts is plenty of overhead for U9 to function properly.

Having said that, Dale probably has more experience with the PFR3 than anyone except Steve Weber so, as he says, "It will be interesting to see as this unfolds".

Best of luck with your troubleshooting.

73.......Steve Smith WB6TNL

From: Dale Putnam <daleputnam@...>

It appears to be a short in the tx.. suspect finals most. But you already are headed there. Should be able to find that short with an ohmeter with no power applied. It will be interesting to see as this unfolds,

To: pfr3_group@yahoogroups.com
From: sm4lra@...

Hi Steve and Dale!
Did my testing on my dumy load and my troubbles developed further.
The reseiver works well and every other funktion on the four buttons like up and down rit and so on but, when i did key down the sidetone rise for about two seconds and then the radio simly shut down.
As its still in the case just did few measuments . when i started it up again the RX works again and the 5 V regulator turns out 5V. then when i hit the key the thing turns of instantly and the regulator givs some 3,8V and holding. It is reset by cuting the power. The input on the regulator drops slightly from 10.17 to 10V.
It Puzzels me what can draw so much current after the stabilizer. next get it out of the case .

OK Bob
True, it's a technique more diffi we believe at first.
It takes speed directly is difficult because it is limited by the diameter, is a law of the universe HI
Or should a major power in the wind and many multiplications rpm.
You're right, turn quickly to more than 3,000 rpm
The wind sensor horisontal "S"is very powerful as it is a bit wide, but the mechanism is more direct and easier for the amateur builder.
I laugh a little because it put in a backpack to go QRP expedition sounds like a cartoon ... H.I.
There may be small wind sensors kits low power?

Felipe,

This is usually caused by paint buildup on the circumference of the hole. Light scraping to remove the paint should correct the problem and the connector will fit.

Hi Guys, Yep, the paint builds up in the hole. Ive taken it out with a hand driven drill bit, and I've seen it taken out with a knife, but all that has to be taken away, is the paint IN the hole. The trick is choose something to take the paint out of the hole, and don't let what ever it is, escape from the hole. If it does escape, a not pretty scratch will appear, and possibly some not nice words. or maybe more words... if the choice of tools is sharp and punctures your skin... in which case, work will terminate, bandaid application will insue, and more not nice words will be spoken. How do I know this? That... my friends.... is a whole nother story....

JP,

The bridge circuit in the Deluxe Tenna Dipper is essentially the same as the bridge in the PRF3A. The bridge resistors in the PFR3A provide a proper termination to the source (transmitter) so there is no danger to the PA transistors even under conditions of load mismatch or extended transmit periods during tuning.

Of course, the less time one spends tuning on the air, the better for fellow hams. That is the advantage of the Deluxe Tenna Dipper; it outputs a very low-level signal so as to reduce the possibility of interference to others.

Yes, a meter could be added for an analog indicator. It would not need to be a Galvanometer; a simple mA meter would work. If I were to add it to a PFR3, I'd mount a 3.5mm jack to the back panel with the meter in a small external housing.

Hi Christer,
The diode checks ok, that would be D7. I'm thinking that the finals may be suspect, and unless you have them all unsoldered, can you measure the voltage on L7? both sides of L7, when you first key it. You should see the keyed 12v appear. If the finals are not seeing a good match or load, then they will go overcurrent, that would draw down the voltage supplied to the two regulators, 5v and 3.5v. If they drop, the uP gets unhappy and resets. So, lets measure the voltage at D5 too, when keyed.
I'll be back about 1200z in the morning.

Subject: Re: [pfr3_group] PFR3 troubble.

Hi Dale !

I get more and more puzzeled, anyway I did remove eg. cut the diod leg on the ground side and lifted it upp. One way I get infinet resistance OK. The other way around i get a couple of MOhm. Could it be burned off ? then it would not drive the curent shuting the radio down on TX.
Then to my surprice measuring on the finals i get
S 0ohm ofcourse.
G 1,4 ohm should it be so low but at least no change.
D about 60 ohms. how come ? it was about 280 before.
This i dont get . Can a Zener diod make this kind of effect?
I dont think so but still...?
Then there is the gate on the finals . shut it be sa low at 1,4ohms.
about 60 ohms on the output ?????

What do you think ?

Yes, Steve was referring to the regulator. But before you swap it, maybe a check on the output of the regulator would give more information?
I think it is U5 on some of the schematics, and mislabeled on others as U9... Or correctly labeled for that particular radio version.
The Q7-9 should be the finals, those would be the ones that I was considering possibly being shorted... and a check with an ohmmeter, would tell that, in circuit.

Hi Steve and Dale!
Did my testing on my dumy load and my troubbles developed further.
The reseiver works well and every other funktion on the four buttons like up and down rit and so on but, when i did key down the sidetone rise for about two seconds and then the radio simly shut down.
As its still in the case just did few measuments . when i started it up again the RX works again and the 5 V regulator turns out 5V. then when i hit the key the thing turns of instantly and the regulator givs some 3,8V and holding. It is reset by cuting the power.
The input on the regulator drops slightly from 10.17 to 10V.
It Puzzels me what can draw so much current after the stabilizer. next get it out of the case .

Yes Steve all OK
This principle is also used in the BLT + and well known.
But this little device is interesting because it is well built and easy to put in your pocket.
I think an integrated circuit with a small group of 5 or more LED would be nice also for a better visu return HF, but it's a bit complicated to +, a tiny s-meter would be nice I suppose, but every little improve the way it naturally, and test during assembly.
The small states on the same frequency and gives a quick idea in a small volume, I am tempted, because the metal case is well and we can finish the installation with the options you want is still a good idea.
I always regret that the tins for DCxxB are no longer sold, I know there is the drawing of the box, but without a bending machine, do as well as small and it is not easy.

Hi Dale !
I did reconnect D7 .
Then I did measure both sides of D5, L7 and output of regulator U10 and U5 and the legs on Q6 both in RX and TX or at least sort of TX mode.
When I hit the key the processor cuts of instantly the display goes black and the reciever stops to resieve. left in tx or ratehr shut down mode the 5V regulator gets quite hot after a while. I did use the internal battery that produce about 10.4V.

RX Volts. D5 in 10,39V D5 out 10,13V. L7 in and out 0,005V. U10 3,3V.
U5 5,02.

Q6 Sourse 10,06V Drain 0,005V Gate9,95V

TX volts. D5 In 10,31V D5 out 9,98V. L7 in and out 0,023V. U10 2,85V. U5 3,23V
Q6 Sourse 9,98V Drain 0,022V Gate 9,87V

I vill order three BS170 tomorrow and I will get them in a couple days. Any other sugestions you might have given the above results would be nice.

Hi guys,

Just finished my Antenna Dipper purchased from Doug at Dayton. It worked the first time and with the exception of the following minor items the instructions were excellent.

Some suggestions:

1. Put resistor color codes in the parts list.

2. The LED for SWR indication did not have a flat side. I suggest adding the line out of the PFR-3A instructions that the long lead is opposite the flat side shown on the circuit board.

3. The instruction to install the base of the LED 1/2 inch from the board should be changed to 1/4 inch to 5/16 inch. An easy way to get this correct is to insert the LED leads into the circuit board, then insert the LED and the circuit board into the case with the LED protruding through the front. Temporarily fasten the board to the case with 2 screws diagonally and solder the leads. You now have a perfect fit.

4. It would be helpful to know the length of #30 wire required to wind the torroid. 51 inches of wire were included with my kit. A 19 inch length works well for 30 turns and 6 inches works well for 5 turns.

Many thanks to Doug and Steve. Well done.

Keith

Mike, great!

You are in for a real kit building treat! I had my little yellow station-in-a-box on the air from my backyard deck this past weekend. Of all the 20/30/40 meter contacts, my favorite was with a "classic" QRP rig, WB9UDL's Heathkit HW-9!

I couldn't resist recording Steve's audio! http://www.youtube.com/watch?v=7F8SUjiI5Zw

Hi Christer,
If you were to insert a milliameter, in series with L7, and key the tx, what does that read for current?
If I have this right, the whole radio shuts down when you key it, right?
So, if you lift one end of L7, and leave it open, then key it, does the radio shut down?
If not, but it does when L7 is connected, that will be a huge leap of progress.

Subject: Re: [pfr3_group] Hendricks Deluxe Tenna Dipper Kit

Hi guys,

Just finished my Antenna Dipper purchased from Doug at Dayton. It worked the first time and with the exception of the following minor items the instructions were excellent.

Some suggestions:

1. Put resistor color codes in the parts list.

2. The LED for SWR indication did not have a flat side. I suggest adding the line out of the PFR-3A instructions that the long lead is opposite the flat side shown on the circuit board.

3. The instruction to install the base of the LED 1/2 inch from the board should be changed to 1/4 inch to 5/16 inch. An easy way to get this correct is to insert the LED leads into the circuit board, then insert the LED and the circuit board into the case with the LED protruding through the front. Temporarily fasten the board to the case with 2 screws diagonally and solder the leads. You now have a perfect fit.

4. It would be helpful to know the length of #30 wire required to wind the torroid. 51 inches of wire were included with my kit. A 19 inch length works well for 30 turns and 6 inches works well for 5 turns.

Many thanks to Doug and Steve. Well done.

I mentioned earlier I am going to build a PFR-3A for a friend and I have been studying the manual and specs on the thing. I've come to the conclusion this is a very very nice radio for the money. It covers the three most popular CW bands, has an honest 5 watts output, is fairly small, memory keyer, and has a nice receiver with full 3 band coverage. That's pretty nice for $240.
I have a lot of interests in communications and electronics mostly in amateur radio, but I am also interested in tube audio equipment and am building up an eight EL-34 amp right now. I have a big interest in QRP rigs as well as glow bug rigs, boat anchors, Collins, Drake (Paraset reproduction, Philmore NT-200 reproduction, and Ameco AC-1 reproduction) and others just to mention a few. I have a RCA BTA-1R2 1 KW AM broadcast transmitter I need to restore as we speak. I own a SX-88, Collins KW-1 and many more other pretty rare radios. I won't go into details as my XYL might read this. I don't even want to think what I have invested in radios. I am not bragging but just trying to make a point. My interest in QRP is mainly with CW rigs but there are some exceptions such as Dave Benson's RETRO 75. I have almost zero interest in buying a $1200 QRP rig with add ons to take it to 100 watts or want SSB and AM on the thing. Sure, I'd take a rig like this if offered for peanuts but that is not going to happen. I'm sure this new radio everyone is talking about will work great and sell well. I certainly could afford buying a radio like this if I really wanted one, but I would never use it at 100 watts and never use it on voice with any voice mode. I have plenty of rigs doing all that right now, even in a small case such as my FT-857D. I surely don't begrudge anyone wanting a do it all QRP radio with add ons hanging everywhere but this type rig is not for me. No, a fairly simple 3 band, digital display 5 watt QRP rig with a memory keyer is right up my alley. The PFR-3A will do 99.9% of the things I would like a QRP rig to do and all for around $240. Why spend $1200 plus for a rig with features I will never use which I do use on other none QRP rigs?

I've been licensed since 1953 and can tell you I still get bigger thrills out of using some small 2 or 3 transistor transmitter with a small direct conversion receiver then I ever do running some big bucks radio. Bigger is not necessarily better! There is something to say about KISS (keep it simple stupid). Couple your PFR-3A to a solar powered supply and the magic will commence riding your magic carpet!
You guys with PFR-3A rigs are not as dumb as you look! I would say you are at the genius level. You made a very wise choice.

Lee,

I think you will find this little radio even better than you imagine. The only real challange for me was winding the torroids. I am 63 and have a bit of the old hand shaking problem.The internal antenna tuner will tune almost anything made of metal as long as one has patience. Yesterday I finished Steve Webbers Tenna Dipper. It worked the first time and is giving me the same results as my MFJ259 analyzer. Have a great time.

Hi Dale,

I think I see where you're going with this; finals drawing -way- to much current causing a power transient at the input to U5 causing it to glitch? Have you ever seen a 78L05 latch up like that on a transient? And why would it get hot? It's obviously U5 causing the uP to hiccup. Other than something going -way- wrong w/ U8 I can't see anything else causing the problem.

Lee,

I think I know what you mean, and I share your view :-) In fact I
would probably not buy it even if it came for peanuts. If I wanted
a computer with as few knobs than I've already got plenty of them,
just need to add the knobs :-)

Let the flames begin ...

Hi Steve,
Yes, I've seen the finals draw so much current that the uP resets, if the regulators don't get started right, or there is a hitch in the process of restart things don't get reset correctly. Also seen a solder short in the U8 driver that when the tx keyed would lock it on or stick it to high current and get way hot. If L7 is lifted, and the finals are eliminated from consideration, then a key down for a long time will help in finding the problem area. Checking the 5v rail will be helpful keyed, unkeyed, and looking at u8 pin14 will be helpful too. I had one that had a simi-short, under the ic... took the 5v rail down, during keying, but would release it not keyed. Had to remove u8 clean and resolder it, to correct. At least I call it was a semi short..... although I never heard the air brakes, horn or saw the diesel smoke. ;o)
Have a great day,

I am using a Volkswagen solar charger (used - Ebay - $10 - $15) to keep the internal batts topped off during the day while operating. It delivers just over 100ma of charge and, with the xmit/Rx duty cycle combined with the CW xmit duty cycle, the battery recovers from getting low very nicely.

Go here to see more on the solar charger and the Battery Status Indicator :

I ordered a 10 watt solar panel with controller to run my 7 amp Gel Cell. I'll test the system out using a 5 watt rig and see what happens testing how long the battery performs plus will an average sunlight day keep up with the load demand with brisk usage of the system. More to follow. (I purchased the solar panel as new from a solar panel company out in California selling on e-bay). If the solar panel can keep up with any demand I put on the system, I'll up the battery storage capacity and see how much capacity improvement I get under the new conditions. The hours of sunlight will affect the outcome but over time an average should be possible to be determined.

2495. Microprocessor (or display) noise on 20 meters

Yahoo group: pfr3_group
Date: 2011-06-08 18:17:02 UTC
From: kl7cw
Topic: 2495 Message: 2495

I just built a PFR3A and it works GREAT on all bands. However, I noticed a VERY SUBTLE decrease in 20 meter noise each time the display timed out. When hooked up to a dummy load, the noise sounds exactly like a quiet 20 meter band with sporadic distant lightning crashes. The noise is on the mute line between pin 25 of the microprocessor and the gate of Q1. I bypassed the mute line with a small (less than or equal to 0.25 inch diameter 4700pf(0.0047)disc cap.). The exact value is not critical, but use only a disc cap. It is convenient to install the cap on the top of the board directly above R15. Wire one lead to a T1 ground terminal and the other lead to the R2/D1 cathode junction. This junction is the left terminal of R2. 4700pf is more than enough capacity to eliminate all noise from my PFR, yet it does not slow down QSK. If necessary you can use more capacitance or even add an aditional 4700pf capacitor directly from processor pin 25 to ground on the back side of the board. I only noticed this noise since I live in a quiet rural area of Alaska. Normal QRM and QRN would probably obscure this noise for most folks. It was not enough to significantly degrade the MDS measurements. Rick KL7CW Palmer, Alaska

How deep into the paint?
The auto polish won't remove that scratch and if you use the rubbing compound you lose the shine in that spot.
Best to match up the paint and maybe 10 coats from a yellow marker pen will do the job

2500. Group 2 smoke test question

Yahoo group: pfr3_group
Date: 2011-06-09 05:10:27 UTC
From: Michael
Topic: 2500 Message: 2500

Hey guys,

Please keep in mind I'm a newbie at this. :)

I just finished group 2, and have done the smoke test. I can hear some CW stations on 40m, but my question is, how loud should they be?

I have the volume cranked all the way up, and hear a very quiet background hiss, but none of the stations are that loud.

It is currently 12 midnight here in Missouri, and I understand that the band may not be in the best of shape (late at night and solar flare tonight).

I am also only using a short 10' piece of wire for an antenna for testing.

So tomorrow when I hook up to my end fed long wire and test, what should I expect? My only frame of reference is my TS-820.

I'm pleased that I have gotten this far, I'm hoping the rest of the build goes as smoothly.

Thanks,

Mike KD0MEQ

Hi Mike,

The 10 Ft. antler is most likely your problem. If your end-fed is transformed to 50 Ohms then your PFR should be plenty perky when connected to it. Using sensitive earphones/earbuds and the receiver input connected to a decent antenna connected matched to 50 Ohms you should get good audio volume.

If you don't quite get a peak on the preselector knob ("Rx PEAK") before it hits the CCW stop, don't be concerned. That adjustment may change after the low pass filters are in circuit.

Best of luck with the rest of the build.

2502. Internal NIMH Battery Charger

Yahoo group: pfr3_group
Date: 2011-06-09 07:25:07 UTC
From: lee
Topic: 2477 Message: 2502

Has anyone developed a NIMH charger which will charge these cells while installed within the 8 cell battery holder/holders in a PF3? I would imagine you could use a commercial one made to charge them when in a series configuration rather then those charging them individually.
I realize It is better to charge cells individually rather then in series but that is kind of a pain as you would have to remove them from the rig each time they needed charging. I would prefer to leave the cells in the rig and charge them in series even if it meant replacing the cells more often then if charged the other single cell way. (Due to unbalanced cells)
I looked at the manual I downloaded on line as I don't have the kit yet. The schematic is not drawn correctly for the power switch to work as mentioned in the manual. I have no PC board to examine to see how the rig is actually wired. (The power switch in the manual shows a 3-way switch for "off-internal battery-external battery". However the schematic just shows the 3-way switch to either have the rig "OFF" or powered by the "external power source". There is no reference on the schematic to any internal batteries. Once I get my hands on a real PC board I'll be able to trace what is actually happening with the "Power Switch". (Position #1 is shown as off, position 2 and position 3 are tied together so if the switch is in either pos 2 or pos 3 the rig will be on using external power. This is how the schematic shows the switch wiring). I know this can't be correct if there are internal batteries besides external power available for this rig, so the diagram is wrong.
Once I get my hands on a real PC board I can figure out how to use an external "in series" charger but I can't do that until the kit arrives. Maybe someone on here has already done all this work and developed a charger. I realize, for a charger to be used, caution must be used so voltages don't top 12 volts to the rig. Putting a charger in there while the batteries are connected while they are running the rig could be trouble if a cell failed while the charger was in service while connected to the rig. (Voltages could zoom to 17 volts or so.) It would be much safer to be able to charge the batteries while they were not "on line" and the rig could be used with external power while the cells were being charged.
HOPE THIS MAKES SENSE AND I WAS CLEAR WHAT I WANTED TO SAY!
Has anyone done all this? I don't want to be reinventing the wheel. I could not find anything on the web showing where this has been done to date. However, I could have missed it. I'd be interested in hearing from anyone relating to all this. What is needed is a NIMH series charger to charge the cells while in the radio and the power switch has the batteries "off-line". At the same time, the power switch could have the radio off or powered by an external source. (Yes it could be wired so the batteries power the radio while being charged, but to me, this has an inherent hazard for the radio if batteries fail).

Hi Lee,
Yes I can never fall asleep and I received my VX8GR 2 band HT today.
Now I damaged some brain cells trying to program it.
I have 2 repeaters in memory and when I go to the VFO mode,it changes to AM
So today will be 100*+ F and I have nothing better to do then play with
this.
I could have been just as happy with a much cheaper dual band HT but this
has a GPS built in and get this.
A CW practice menu.
You select all 26 letters and numbers and then play it back at the speed
you want.
I can TX on 2 meters and still listen to 440 and it has a packet modem
built in.
I can receive text on it and every 8 hours it makes me a 20 oz cup of
coffee
Just another pricey toy Diane got for me.
5:40 AM here so I may as well go out for pre made breakfast at 7-11

Helo Lee
Hello everyone
I will make a response as short as possible. (Difficult)
No manufacturer will not allow a parallel charging of cells on a transceiver or other, or he is an inverter
neutral point to media, which prohibits the placing in service for charging.
Otherwise, it is possible to maintain the load a regulated supply with the same number of volts to the final charge voltage of the cells. is an acceptable solution but it is not a proper charge.
The reason is simple, and we know the potential difference is that this will not be supported by the device because for the load normally happens is much higher than normal.
Yes, you must first load and during a control of the precise balance of cells, because a load of all cells in series can be valid only if they are perfectly within the same state, without going into technical details. (Must also carry out regular landfills and observe the status of individual cells)
Good chargers do know seriously.
Otherwise, you must load them individually into effect.
A load cell in series may be acceptable during a time when they are brand new and identical initially.
It will simply check regularly that the potential difference is the same for all during charge and discharge, which is not easy ... H.I.
In cell Li-Ion and Li-Po of 3.6 V and 3.7 V is very important and usually the charger is supplied with the cells and it is perfect.
I recommend buying a Multi - cells, it is a good investment that you will not regret, battery chargers for serious models have a suitable electronic control and report errors and impossibilities of charge.
I was rather long, sorry, but there a lot to say on this subject, and thousands of ham radio are not familiar with the
problems of the cells.

Hi Dale !
Here is the next part of the PFR3 "I don´t want to transmit" story
I did as you said lifted L7 on one side. Power on yes, hit the key, oh no shut down.
resistans between gate and drain 1,4 ohms.
Ok kill the 5V to the finals, lift U8 of the board.
Same test again, bingo.... every thing looked ok the keyer worker and every thing else to.
my thought the finals is shorted. i did measure on one of the new ones I did buy.
It is a pitty i did not check the resistans between Gate or say pin 13 in the U8 socket.
I did unsolder the three BS170 and did resistance check on them , non looked like they were broken.
Ok put back U8 and power it up. ok.. key down.. instant shut down. shi.....
OK out with U8 same test . worked ok.
Solder back L7. same test ok.
Put back U8 and power it up. ok.. key down.. instant shut down.
So as it is i have ordered a new 74HC02 Nor Gate.
As far as i see it there is no place were big enaugh currents could slip away left.
Whats your comment on that.

Hi Christer,
  If you were to insert a milliameter, in series with L7, and key the tx, what does that read for current?
If I have this right, the whole radio shuts down when you key it, right?
  So, if you lift one end of L7, and leave it open, then key it, does the radio shut down?
If not, but it does when L7 is connected, that will be a huge leap of progress.

Hi Christer,
Sounds like you isolated the issue with U8... now that it is out, and you're stuck waiting for a new one... how about taking an ohmeter reading across U8, pin 14 to pin 7. Then treat it as a diode, reverse the ohmeter leads and measure again. Maybe that would help us to understand what happened.?
That reading should not be low, both polarities.

resistans between gate and drain 1,4 ohms.
Ok kill the 5V to the finals, lift U8 of the board.
Same test again, bingo.... every thing looked ok the keyer worker and every thing else to.
my thought the finals is shorted. i did measure on one of the new ones I did buy.
It is a pitty i did not check the resistans between Gate or say pin 13 in the U8 socket.
I did unsolder the three BS170 and did resistance check on them , non looked like they were broken.
Ok put back U8 and power it up. ok.. key down.. instant shut down. shi.....
OK out with U8 same test . worked ok.
Solder back L7. same test ok.
Put back U8 and power it up. ok.. key down.. instant shut down.
So as it is i have ordered a new 74HC02 Nor Gate.
As far as i see it there is no place were big enaugh currents could slip away left.
Whats your comment on that.

Hi Christer,
If you were to insert a milliameter, in series with L7, and key the tx, what does that read for current?
If I have this right, the whole radio shuts down when you key it, right?
So, if you lift one end of L7, and leave it open, then key it, does the radio shut down?
If not, but it does when L7 is connected, that will be a huge leap of progress.

Hi Jim
Look at this side
I am satisfied with this equipment, no problem, but good inexpensive operation, Li-Po batteries 3 elements 5000 mA / hr or even more! ... work well for small transceivers also , out of 12 V ... very fine , no problem tested

☐

Helo Lee
Hello everyone
I will make a response as short as possible. (Difficult)
No manufacturer will not allow a parallel charging of cells on a transceiver or other, or he is an inverter
neutral point to media, which prohibits the placing in service for charging.
Otherwise, it is possible to maintain the load a regulated supply with the same number of volts to the final charge voltage of the cells. is an acceptable solution but it is not a proper charge.
The reason is simple, and we know the potential difference is that this will not be supported by the device because for the load normally happens is much higher than normal.
Yes, you must first load and during a control of the precise balance of cells, because a load of all cells in series can be valid only if they are perfectly within the same state, without going into technical details. (Must also carry out regular landfills and observe

the status of individual cells)
Good chargers do know seriously.
Otherwise, you must load them individually into effect.
A load cell in series may be acceptable during a time when they are brand new and identical initially.
It will simply check regularly that the potential difference is the same for all during charge and discharge, which is not easy ... H.I.
In cell Li-Ion and Li-Po of 3.6 V and 3.7 V is very important and usually the charger is supplied with the cells and it is perfect.
I recommend buying a Multi - cells, it is a good investment that you will not regret, battery chargers for serious models have a suitable electronic control and report errors and impossibilities of charge.
I was rather long, sorry, but there a lot to say on this subject, and thousands of ham radio are not familiar with the
problems of the cells.

It's also possible that one of the output pins of U8 is shorted to ground, due to a solder short on the board, which I would think is the most likely cause of the problem.

Steve KD1JV

Hi Christer,
Sounds like you isolated the issue with U8... now that it is out, and you're stuck waiting for a new one... how about taking an ohmeter reading across U8, pin 14 to pin 7. Then treat it as a diode, reverse the ohmeter leads and measure again. Maybe that would help us to understand what happened.?
That reading should not be low, both polarities.

Subject: [pfr3_group] Microprocessor (or display) noise on 20 meters

I just built a PFR3A and it works GREAT on all bands. However, I noticed a VERY SUBTLE decrease in 20 meter noise each time the display timed out. When hooked up to a dummy load, the noise sounds exactly like a quiet 20 meter band with sporadic distant lightning crashes. The noise is on the mute line between pin 25 of the microprocessor and the gate of Q1. I bypassed the mute line with a small (less than or equal to 0.25 inch diameter 4700pf(0.0047)disc cap.). The exact value is not critical, but use only a disc cap. It is convenient to install the cap on the top of the board directly above R15. Wire one lead to a T1 ground terminal and the other lead to the R2/D1 cathode junction. This junction is the left terminal of R2. 4700pf is more than enough capacity to eliminate all noise from my PFR, yet it does not slow down QSK. If necessary you can use more capacitance or even add an aditional 4700pf capacitor directly from processor pin 25 to ground on the back side of the board. I only noticed this noise since I live in a quiet rural area of Alaska. Normal QRM and QRN would probably obscure this noise for most folks. It was not enough to significantly degrade the MDS measurements. Rick KL7CW Palmer, Alaska

Very good to know and very interesting. I'll keep this in mind when building the kit.

I received my 10 watt solar panel today with charge controller I purchased new off of e-bay today. The size is: 10 1/2" X 15 1/2". It is designed to charge 12 volt batteries. Maximum power voltage across a battery is 17.2 volts and the maximum current is .59 amps. The controller will handle up to 10 amps input and 10 amps output. I think this will work very well with my 7 amp gel cell. The WA4MNT PFR-3 over voltage protection and charger look great too.

Hello Jean-Paul
The added 4700 pf capacitor is not an official "Hendricks" recommended modification. I do not yet know if my trouble was an isolated instance. Hopefully others will post to this group if they have observed this problem. I posted it so that if anyone else observes this, they can try this modification. If the PFR is already mounted in the case, the bypass cap could be installed from pin 25 of the processor to ground, or perhaps elsewhere on the bottom side of the board. Although I think it very unlikely that this capacitor could have any adverse effects(none were observed), you can just wait and see if there are any more posts,or if you in fact have this problem. If this noise is observed by others, perhaps Hendricks will recommend bypassing this line, just to ensure the problem does not come up for some future builders.

I need permission from Hendricks to install a bypass cap? To try a simple bypass cap to possibly remove some hum is not a BIG THING and certainly doesn't need a sellers permission! This is not major surgery.

If you have a problem try it. If you don't have a problem forget it. In fact, if you have the problem and wish not to try and rectify the problem, do that too. We certainly don't need a heads up nod it's OK to use an extra bypass cap somewhere in any rig including a PFR-3 from Hendricks or anyone else. The cap can't do any harm and could possibly rid you of a problem.

With all the mods I put in my QRP kits, the idea of possibly adding one bypass cap somewhere would not have me give it a second thought.

Bob's suggestion of making sure ground screws are tight and jacks are properly grounded and not insolated by paint is also a good tip everyone should always consider anytime a kit from anyone is put together.

Bob also mentioned grounding the crystals (filter crystals). Sometimes this helps and sometimes it doesn't matter. For what ever reason, it helps with some rig designs and not in others. Doing it certainly should not hurt anything unless the ground leads are too long. I have no experience doing it or not doing it with a PFR-3.

Winding the big bad T3 in a few minutes. So far all smoke tests and voltage test have checked out. The voltage checks on pins 1 and 13 of U8 were a bit low, but I have a cheap volt meter and the instructions said that the readings could vary depending on what volt meter you have.

There were just a few missing parts (resistors and capacitors) but nothing I couldn't replace at our local electronics store (Gateway Electronics). I could have reported the missing components to Doug, but I didn't want to wait.

A ham friend of mine is going to help me align and test the radio Sunday. He has all the cool toys needed for a proper alignment.

All in all it has gone together well, and I now feel like I know how to properly wind a toroid. Of course we will find out Sunday how well I did! :)

Hi Dale and Steve !
I cant find out what really did go wrong , beats me.
First a recap for you Steve. Have worked about 30 QSOs with this litle fantastic rig on all the bands and everything went alright. Some qsos on 40 m with an enfeed halfwave antenna and the BLT on. som from my own QTH with my fixed antennas. via the BNC connector.
And so was the case when it did break down.
First it just shuted down.
After restart the reseiver did work ok but when i hit the padle the side tone did go up and the display did flicker in intencety then shut down after a couple of seconds.
then it did shut down every time i did hit the padle.
There we are to day
 After some testing and finaly removal of the BS170 findig out that they were ok i removed the 74HS02 ant then it worked.

I did suspect some short on on the board but I have looked it over with a magnifying gals (from 4 to 25 times) over and over again and not found eny such problem.
Reversing the U8 no, possble but no.

A static discharge possble but i do not think so i was very cerefull and did ground me and the board before puting it in place.

So now i did check the output pins on the IC socket with the IC removed. also i have not replaced the BS 170s yet. and the value was infinet resistanse.
Measuring across leg 7 and 14 on the IC i got about 4,7 kohms both ways.(with the IC on the table.)

Do you have any commets on this so please tel me.
I hope it will work when i get the new IC. I would like to use it on a small trip this thursday. I have other equipment but they are a lot more cumbersome.
 Have a good weekend.

Christer,

I didn't know the rig had been working, I though it was a new build.

What have you been using for a power supply? If you have been using batteries, it is possible they are still good enough to run the receiver, but die when trying to transmit. If you are using the batteries internal to the rig, some people have had trouble with the battery holders developing a high resistance.

If on the other hand, the rig still acts up when using an external, regulated mains supply, then you will have to hope U8 did indeed go bad for some reason.

Steve

Hello Bob
and hello to all
It has nothing to do, of course, but on the TEN-TEX Jupiter, I had everything apart due to RF feedback. and make changes, yet the reputation is good, but the old principles are forgotten! ...
By inspecting it carefully, it is certain that the correct connection of the masses of the plates and the housing is very important.
The output coaxial connector must be fully chassis, and all bodies of Jacq paddle and HP and others.
All masses of coaxial cables should be checked.
Coaxial cables should not happen in the same ways that other son of power, they must be well bonded to the sheets with adhesive tape and be as short as possible.
All screws should be in contact with the sheets and boxes of paint must be removed.
Many problems come from this
It is interesting to add small ferrite around and from some of the RF cable for HF is present strong
Both Key to exit or paddle as 12 volt or speaker.
leaving the antenna cable is often a good solution too.
Also do not héziter to add decoupling capacitors of several values in parallel, chemical 10 nF and 100 nF between the + volts and ground.
after these changes, made to test gradually we are often surprised to find that the problems have disappeared.
Good luck in solving these problems annoying.

Hi Jean,
I think the 2 band rig for Europe is the same as the one from Ten Tec.
Same rig and no changed.
This is the first time I ever heard on a rig not being able to transmit on
1 band because the person used an end fed.
I have the MFJ 20 meter whip with a base loaded coil and it works like a
champ even indoors.
When I take the pfr3 out and just use it with my mobile Hustler it just
seems so quite and I don't hear any strange noise.
I did bind the entire rig and also the crystals.
I'm sure that one chip he removed is defective.

Hello Bob
and hello to all
It has nothing to do, of course, but on the TEN-TEX Jupiter, I had
everything apart due to RF feedback. and make changes, yet the reputation is good,
but the old principles are forgotten! ...
By inspecting it carefully, it is certain that the correct connection of
the masses of the plates and the housing is very important.
The output coaxial connector must be fully chassis, and all bodies of Jacq
paddle and HP and others.
All masses of coaxial cables should be checked.
Coaxial cables should not happen in the same ways that other son of power,
they must be well bonded to the sheets with adhesive tape and be as short
as possible.
All screws should be in contact with the sheets and boxes of paint must be
removed.
Many problems come from this
It is interesting to add small ferrite around and from some of the RF
cable for HF is present strong
Both Key to exit or paddle as 12 volt or speaker.
leaving the antenna cable is often a good solution too.
Also do not héziter to add decoupling capacitors of several values in
parallel, chemical 10 nF and 100 nF between the + volts and ground.
after these changes, made to test gradually we are often surprised to find
that the problems have disappeared.
Good luck in solving these problems annoying.

I am getting into this PFR-3 radio late in the game. I understand Hendricks no longer sells a paddle for the radio. Is there someone making a similar paddle to the Hendricks type these days? I think maybe Ren has some paperclip kind of thingy and W5JH has a “straight on” paddle kit. I’m not sure I want a bolt on “straight on” paddle and I don’t think I want a paper clip type thingy either. I think I would rather use an independent paddle then have a bolt on “straight on” paddle mounted on the radio.
Who is making/selling a Hendricks type angle paddle these days?

Bob,

I confirm that those Ameco keys are cheap and very functional.
Due to the low price one can easily buy more than one and get
creative, like I did :-)

Hi Lee,
I have one of Ren's paddles for hte PFR3, and it is a good, simple, easy to use, easy to adjust, robust paddle. Mine had an issue when it arrived, spoke with Ren, five minutes fixed it. Besides a fine fellow to talk with, I now have a good paddle to carry on my PFR3, that I can count on being there, when I need it next.
It fastens to the PFR3 with the same screw mounts that don't require any additional drilling. Very nice indeed.
Have a great day,

Hi carlo,yes when I was a Novice in 1974 I put 2 of the radio Shack oval type keys back to back. For 4.99 you got a nice straight key with ball bearings that was very smooth and the other one for $10.00 just doesn't make any sense to home brew one. I saw that palm paddle and I just can't see myself paying over $100.00 for that. For 30 dollars more you can get a nice Chrome Bencher Bob AF2Q

Hello Bob
Yes, it's the same version, sure, why do four different models to distributors? it would not make sense ...
The mine is 3 bands, bought directly in China, so I can not speak to those sold by 4 companies.
in the soft (chip) is certainly not the same, and hard inside probably not, I have not seen pictures.
In any case, I've never heard of models 3 or 4 bands since ...
But mine is no problem with all kinds of antennas, I can not criticize this construction is successful, a pity that in making ale was stopped because the band was No. 4 on the road.
I wish I had the components and documentation for him ...
Well, this is so, we must forget ... H.I.
I received an email from Doug who asked me to apologize because there will be late for my pfr3 (for June 20 is good) it's okay for me, to family life as well, I told him "no problem ...

Hi Jean,
I think the 2 band rig for Europe is the same as the one from Ten Tec.
Same rig and no changed.
This is the first time I ever heard on a rig not being able to transmit on 1 band because the person used an end fed.
I have the MFJ 20 meter whip with a base loaded coil and it works like a champ even indoors.
When I take the pfr3 out and just use it with my mobile Hustler it just seems so quite and I don't hear any strange noise.
I did bind the entire rig and also the crystals.
I'm sure that one chip he removed is defective.

W5JH has a Black Widow paddle that fastens onto the PFR3, with larger finger plates that work great with my clumsy fingers... (after handling horses all day, with ropes and saddles, my hands get clumsy) It is a larger footprint than Ren's, but it feels good too. And it matches the Baby Black Widow that I have on the operating desk too.
Very nice, and it polishes up very nicely too.
I like the looks of it very well, although I am not going to subject it to the saddle bag, like I do Ren's. Two different paddles, two different applications... both send very well, I usually ragchew about 20 - 25 wpm, so they both are nice for that too.
Have a great day,

Mike,

yes, to me that thing looks a bit like a two-legged dinosaur with its
neck leaning downwards to eat grass :-) But it works really great! I
believe that to get something as functional, completely adjustable,
but ready-made, you may have to pay big bucks! And I wanted it to be
heavy, so the whole thing is about 3.5 pounds. It stays put, and it
feels really good to operate.

Thanks everyone for the input on all this. I've come to the conclusion, for now, use an outboard set of paddles to one's own liking for the following reasons:
1. I have paddles, so there is nothing further to buy.
2. If a set was bolted to the radio, I would prefer them to be on an angle so the radio was facing you square.
3. Bob is right, a bolted on set would snag other objects and make the thing bulky.
4. I guess nobody is selling a Hendricks type set right now, anyway!
5. The yet to arrive kit most likely won't be used much in the field and most likely used in a ham shack, so a discreet paddle could easily be used.
Lee, w0vt

Hi Le,
Many people told me they did not like the paddles that plugged in at an angle like shown in the picture.
Snags on other items to easy and some even broke off the Jack.
What Rem made I thing needs 2 holes drilled but from looking at the picture they do fold back and so far I heard nothing bad about them,.
He also had a few made for guys to use to see how they liked them and all reports were good,.
$45.00 I think but he does put a lot of time into making them.

Hi Lee,
I was speaking of the HENDRICKS type because the way they stuck out.
What Rem has been building,they fold up and against the radio.
However I just feel that I rather have a 3-4 foot cord,set the rig on the dash and have my small paddles velcroed to the clip board.
Staples has some nice neat bomb proof hard plastic boxes from tiny to shoe box size and no matter what size their $2.00 each.
They even have latches on them to keep the top on nice and snug.
I picked up several smaller ones fro my small paddles,cords,spare parts,antenna wire and a larger one for the pfr3.
the rig gets wrapped in soft cloth and the smaller boxes fit in the larger one just nice and I have everything sealed and all items in one box and nothing gets banged up another item and cause scratches.

Hi Lee,
I did post the link and Morse does not make the keys.
They just sell them and that one with the oval base I think is made by Ameco and have been making them for years.
Well I purchased the large paddles that look gold but they were not the one dipped to give it that nice shine.
About a year later I wanted the small brother to that and I told them about the first one thinking they would give me a break but they never said a word.
They have a nice bug for $1,499.00.
All your buying it all the time polishing and several dips in the chrome vat.
But I looked at the small palm paddle and there is no way I'd drop that much money on such a tiny gimmick.

Subject: [pfr3_group] Paddles

I am getting into this PFR-3 radio late in the game. I understand Hendricks no longer sells a paddle for the radio. Is there someone making a similar paddle to the Hendricks type these days? I think maybe Ren has some paperclip kind of thingy and W5JH has a “straight on” paddle kit. I’m not sure I want a bolt on “straight on” paddle and I don’t think I want a paper clip type thingy either. I think I would rather use an independent paddle then have a bolt on “straight on” paddle mounted on the radio.

Who is making/selling a Hendricks type angle paddle these days?

Lee, w0vt

Dale:

How much time did it take to “build” the Black Widow paddle for the PFR-3? (I don’t have a lot of patience for stuff like this. I get bored very quickly. That’s just me. I’m not sure I could stay at a project like this).

Subject: RE: [pfr3_group] Paddles

W5JH has a Black Widow paddle that fastens onto the PFR3, with larger finger plates that work great with my clumsy fingers... (after handling horses all day, with ropes and saddles, my hands get clumsy) It is a larger footprint than Ren's, but it feels good too.
And it matches the Baby Black Widow that I have on the operating desk too.
Very nice, and it polishes up very nicely too.
I like the looks of it very well, although I am not going to subject it to the saddle bag, like I do Ren's. Two different paddles, two different applications... both send very well, I usually ragchew about 20 - 25 wpm, so they both are nice for that too.
Have a great day,

Hello to you
Really, I look at these things and I am a bit surprised
he did nothing reasonable in the prices of these key, it's better to build ...
I bought a Bencher Used in France the BY-1 black, it was a little dirty and needed some minor repairs.
I bought 50 € (about $ 35) and I am glad it is like new, I took time to repair it because it is a good object.
I understand that this is very personal, it is an object that is a natural extension of the Morse operator quality
and an operator can tell the quality difference to the touch in an extraordinary way.
But even as I think it's a bit much sometimes.
So for prf3, I want to have a simple double touch, screwed over and I take my time to build, or else I'll have to find a reasonable price, because I'm not a great operator Morse paddle key that deserves this award, HI

I am in the process of constructing a PFR3 and wanted to clarify the wingding of T1. The diagram and explanation in the construction notes are not that clear.

My understanding is to wind the 40 turns of the secondary onto the powdered iron core bring the wire out into a loop and continue winding the 5 turns of the primary after the 40 turns of the secondary. Would this be correct?

Thank you for any assistance.

Yes Ray, That is correct, with enough of a loop to tin, then cut, and insert. I usually leave about 1/2 inch of a loop, then also hold everything in place with a drip of candle wax, until it is soldered in place. By then the candle wax may run a bit and hold the toroid in place too. It is a good radio. Have a blast with it,

My friend asked me to build a PFR-3A for him. He is a new ham. I agreed and ordered it for him and he paid me for it. The kit has not been received but a small wait was/is expected in receiving it. In the meantime, my friend had second thoughts and wishes to put together some simple kit himself and was wishing he had not ordered the kit. I offered to buy it from him, as over the last couple of weeks, I realized what a nice rig it is and I wanted one for myself anyway. Now the yet to arrive kit will be mine. I didn’t go to Ham-Com this year so I saved $300 by not going. I’ll rationalize buying the kit with the savings of not going to Ham-Com.

Hey guys,

Went over to my fiends house to align and test the PFR-3. All tests passed with flying colors. He is very experienced and said it sounded great.

Took it home and connected to my Par End Fed 10/20/40 and heard several nice loud signals. During the stage 2 smoke test I thought the signals sounded a bit low, but they are nice and loud now. In fact, two of the signals were so loud I had to turn the volume down. Heard nice signals on all 3 bands.

Still haven't transmitted yet, I am going to use a K1EL keyboard keyer/decoder while I'm still learning.

Anyone up for a QSO tomorrow afternoon/evening? It would be cool if my first ever CW contact and first contact on the new radio was to another PFR-3. Before you volunteer, keep in mind I'm a total newb at this!

Hi Steve,

First off the guy is my friend and he was not going to back out of the deal. In fact he already paid me for the kit. I was going to build it up free for him. Since I fell in love with the rig over the last few days, I suggested I buy it back from him so he could build a simple kit up himself. (I really think he could have built up the PFR-3A). He said OK if that is really what I wanted to do and there would be no hard feelings. I suggested a SW kit, but frankly, I think he is going to build something even simpler then that. (Probably near being a toy). I gave him a list of kits to ponder. What ever he buys, I'll help him with it if he runs into trouble. In the meantime, I got this great kit coming my way!

I'm building a home on a lake, nearly all myself and it is very near completion. It's taken around 9 to 10 years and the XYL wants to move into it, but not until the last nail has been driven. (Basically have to drywall the garage and build an oak stairway and bannister going upstairs). She ain't going to be too happy with me building another kit. Based on KD0MEQ's build time, it should not take very long to put the kit together. Maybe the XYL won't notice me taking a little time off the house project.

Lee, w0vt

Christer,

I didn't know the rig had been working, I though it was a new build.

What have you been using for a power supply? If you have been using batteries, it is possible they are still good enough to run the receiver, but die when trying to transmit. If you are using the batteries internal to the rig, some people have had trouble with the battery holders developing a high resistance.

If on the other hand, the rig still acts up when using an external, regulated mains supply, then you will have to hope U8 did indeed go bad for some reason.

Hello
Would not it be possible to do as we see in some professional editing, a UC vande isolated below the microcontroller and grounded and can be like the above.
The decoupling with capacitors on the legs are also to remember ...
it is sometimes advisable to put the case of the XTAL to ground ... the usual methods to avoid harmonic oscillators ...
The case is closed and it ended the assembly, or they are testing on the table?
Maybe a small memo from the company would be welcome
It's strange, I have not heard of this on older versions of pfr3, users say?
should compare schematics and modifications have been made since ...

Hi Steve, Dale.
Now its upp and running not yet in the box but still, puting out power as it should.
I replaced the U8 and tested . Voltage at L7 and the pads for the BS170s looked ok.
Then i did put in the BS170s and tested, bingo. power out.
Time will tell if it was just a bad component or if I have more to do, hope it´s ok.
I will get it in the box and test it out for real.
Thanks every one for all the comments and support.
I will post a not on how its going later.

OK, Bob. Sure will.

Well, I didn't go work on my lake house today so I could sort parts on the PFR-3A. Unfortunately my neighbor came over and asked I help him again do more hanging drywall in his kitchen. Just got home but now have to have dinner with him. (Maybe late tonight I can sort parts. XYL is a nurse and gets home from work just past midnight. Hope she doesn't have "honey do" projects for me then)! There is no rest for the wicked! Maybe I can sneak in the shack around 3 AM like it's Christmas Eve and do the parts thing!

Hi Lee,
Diane here and Lori are nurses also but they liver hear and there.
Diane got the VX8GR and that new Bug for me.
Come to think of it my ham gear and motorcycles and everything else I own she paid for and no honey do jobs:-)
She and Lori work between the 2 hospitals and in NY they make some unreal big money----------
I was listening to that HB1A and with the old CWF-2 filter it seems to have a very decent sensitive RX.
That old filter seems to hold back any unwanted RX noise.
Right now i'm trying to get the small RS audio amp and that CWF-2 all built up on 1 board and put it inside the rig.
Well it looks like I may be ordering a pfr3 as a spare and to see if I can build that rig so keep me posted on any problems you run into

Hi John,

My only real prior experience building radios was a Small Wonder Labs SW+20 and a PSK-20. You might want to build a Small Wonder monobander first to get the hang of it. Even though you would build it for "practice" you will end up with a very nice single band rig.

The hardest part of the PFR-3 for me was winding and properly stripping the torroids. I found the method that worked best for me was to burn the insulation off with a lighter and very gently clean the burned part away with fine sandpaper. I learned the hard way NOT to try and scrape the enamel insulation away. Be especially gentle with the torroid that uses #30 wire. I snapped the wire off by pulling too hard with the sandpaper.

Pay very close attention to the instructions, double check every part before you solder. Use a good soldering iron and good quality solder.

It really helped me to have a friend/elmer test and align the radio.

I spend about 2hrs over each of three nights building, then an hour or so with my friend aligning.

Good luck...if I can do it so can you!

2572. Unlikely Toroid Stripping Tool?!

Yahoo group: pfr3_group
Date: 2011-06-14 01:53:32 UTC
From: Steve
Topic: 2572 Message: 2572

Some time ago I acquired a Hakko 808 de-soldering tool. This is a gun shaped soldering iron with a hollow tip and built-in vacuum source to suck away melted solder. It actually works quite well:

http://www.hakko.com/english/products/hakko_808.html

Turns out, it's a great toroid or "magnet wire" stripping tool! Prop or clamp the gun vertically with the tip up. Trim the toroid lead just a little longer than needed. Once heated, melt a fresh blob of solder into the hollow tip. Slowly insert the toroid lead to be stripped into the hollow tip and through the solder blob. Wait a second or two, then activate the vacuum trigger. The solder blob and insulation debris are sucked away, leaving the lead stripped and tinned! I find I can strip and tin about 1/2" or a little longer perhaps usually in one shot with this method. Where there's remaining debris, I repeat the process.

I've read of folks using a "solder pot" to strip magnet wire, but have been concerned about the safety given a relatively substantial amount of melted solder they may use. The Hakko method uses a few drops of solder and you end up with a multi-use tool (am I the only one who needs to unsolder stuff?)

A second opinion on how long to build the nice BW paddle for the PFR-3 -- I can't remember! But trust me it takes no special skills. The only real time factor is how pretty you 'need' it to be. This version has a painted base, so it is much easier than the full size BW paddle. It can also be used with other rigs, using a standard extension cable. As the machining is done, it can be built with a screwdriver, some steel wool and sand paper, and a soldering iron. I may have missed a tool, but its likely in your box already.

John

I suggest a lower risk project first, something like a NESCAF or something else you can use - even a regen receiver. After a successful project you should be able to tackle a PFR-3 with one or more elmers in tow. Work your way up to it.

2575. Re: [pfr3_group] PFR-3A Kit Status

Yahoo group: pfr3_group
Date: 2011-06-14 02:23:12 UTC
From: lee
Topic: 2386 Message: 2575

I had a little time this early evening and did inventory all the parts for the kit. Everything was there except for the four knobs. They were missing. I did notify QRP Kits of the fact. I did find a few extra resistors in the pile and a few extra 100 pf COG caps too. I sure don't need the knobs right now and I am sure they will be here before I need them. I'd say the kit was pretty close to being 100% all there.

Some of the caps are really small but with my trustee Almost All Digital L/C Meter IIB, it was easy to identify everything. I have all the caps and resistors taped in order of use on sheets of paper with the values next to each part.

None of the crystals have any "SPECIAL" markings on them so I am not sure which four of the five to use in the filter and which to use in the oscillator. I guess I'll measure the frequency of all 5 crystals and put the closest 4 of them in the filter. I think I'll match all the 100 pf COG caps around the filter too. (Bye the way, the manual does have you ground all the filter crystals to help prevent "blow by").

I am one of the guys who likes "machine grade sockets" so I'll be using them in the build too.

The paint job on the case looks great with no paint blemishes. Nice case. The 12 surface mounted parts are pre-installed and soldered in very nicely.

I don't think there will be much room for some home made heat sinks for the BS170 transistors, but I am thinking of trying to fit some if possible. The Ft Tuthill 80 uses a single aluminum plate epoxied to the two transistors and this really works nicely. I'm thinking of trying three single very thin aluminum plates for the three BS170 transistors in the PFR-3A. Time will tell if this is possible. More to follow.

Hi Steve, Dale.
Now its upp and running not yet in the box but still, puting out power as it should.
I replaced the U8 and tested . Voltage at L7 and the pads for the BS170s looked ok.
Then i did put in the BS170s and tested, bingo. power out.
Time will tell if it was just a bad component or if I have more to do, hope it´s ok.
I will get it in the box and test it out for real.
Thanks every one for all the comments and support.
I will post a not on how its going later.

Christer,

I didn't know the rig had been working, I though it was a new build.

What have you been using for a power supply? If you have been using batteries, it is possible they are still good enough to run the receiver, but die when trying to transmit. If you are using the batteries internal to the rig, some people have had trouble with the battery holders developing a high resistance.

If on the other hand, the rig still acts up when using an external, regulated mains supply, then you will have to hope U8 did indeed go bad for some reason.

Steve

Hi Lee,
I think that was me that mentioned grounding the crystals.
You should see a tiny spot at the base of each crystal.
Some hams ground all on them together then run one wire down to a ground.
I guess that works but looks sort of shabby.

Yes, it was you Bob. I know Ten-Tec did as lot of grounding with a wire across the top. I'm going to just ground each individually as the manual spells out. I know on some rig designs, grounding the crystals does not help reduce 'blow bye" and on other designs it does help.

Hello everyone
Here in Brittany (western part of France) we have used to support our explanations shortcuts hypertext or small photo attachments.
it provides a better understanding of what we are talking.
As the proverb says ham radio, "a picture is worth more than a long discourses ..."
I think I understood that the metal part of this component is any way to ground, and that is enough? even if the leg is also expected to be grounded is not soldered
is that correct? if so it is very usual, but it is possible to control if the two match with a measuring device, it is better that the pass is welded to the potential well is OK.
I am interested because Doug has to mail my pfr3 from June 20, according to the message I received.
So I collect comments friends list who build ...

Therefore the metal tab is soldered to the pad, but the center pin of U10 is not soldered and doesn’t have to be soldered as it connects to nothing. You said U11 and this device only has 4 corner connections.

So what I think you are saying since the device is soldered on the top you don’t need to solder the center pin of U10 as it goes nowhere. Am I thinking correctly?

When looking at U10, the middle leg, doesn't have to be soldered, IF and ONLY IF the metal tab of U10 is soldered. One or the other must be soldered. The tab has more current carrying ability, therefore many builders will choose it, and enjoy the benefit of easier soldering because it is larger. Additional builiders will solder both, tab and leg, to add un-needed solder, or possibly to leave no solder undone.
Good luck with the build,

Hello everyone
Here in Brittany (western part of France) we have used to support our explanations shortcuts hypertext or small photo attachments.
it provides a better understanding of what we are talking.
As the proverb says ham radio, "a picture is worth more than a long discourses ..."
I think I understood that the metal part of this component is any way to ground, and that is enough? even if the leg is also expected to be grounded is not soldered
is that correct? if so it is very usual, but it is possible to control if the two match with a measuring device, it is better that the pass is welded to the potential well is OK.
I am interested because Doug has to mail my pfr3 from June 20, according to the message I received.
So I collect comments friends list who build ...

Yes, I ment U10 and yes, only the metal tab has to be soldered.

I think you said something not correct. I think you meant to say U10 is also connected to the metal tab of the package. Therefore the metal tab is soldered to the pad, but the center pin of U10 is not soldered and doesn’t have to be soldered as it connects to nothing. You said U11 and this device only has 4 corner connections.

So what I think you are saying since the device is soldered on the top you don’t need to solder the center pin of U10 as it goes nowhere. Am I thinking correctly?

Hi Gang,

Just so I get this right, what exactly is the 'metal tab' that is being referred to? I don't see on on my U10. Is it the tab that comes out of the rear of the component and is soldered to the board?

Yes it is that tab, Grant. The leg is the one in the middle, that is also the same connection.

Hello again Steve
No, you do not lose sleep with this, I bought just the same and it will be mailed from the 20 I believe, then the subject of interest for the technique, I think this piece is a regulator or a power component in all cases els it is better that the cooling block and the leg which is to be connected both to ground
But I could be wrong, that's why a capture, or a picture or diagram may be well to understand
Good luck and good fun for mounting above!
This list is interesting

2595. New Build Progress

Yahoo group: pfr3_group
Date: 2011-06-20 04:15:33 UTC
From: lee
Topic: 2550 Message: 2595

I constructed Group 1 for my PFR-3 and then did the diagnostic tests. All came out good. The front ground holes in the circuit board for the stereo jacks are too small to fit so I cut down the oins to fit the holes.
I used machine sockets everywhere. I did not have a 28 pin machine socket for U7, so I used two 14 pin machine sockets in series. No problem.
Beware the is a U8 silk screen marking in two places. Disregard the one in the wrong place.
I also built up the receiver, but have not installed the crystals as I am going to match them as much as possible for the filter before I install them. I did match the five 100 pF caps around the crystal filter and have mounted them. (C-7, C-8, C-9, C-10, C-11) . Once the crystals are installed, I'll be able to try out the receiver. T-1 is a toroid and not too hard to build but much fun installing! That took some time.
You still need to put in a jumper on the board for a small display board error. This is outlined in the manual and easy to do.
There is a warning about two of the three GREEN Mylar caps possibly being too tall to mount on the front of the board. Instructions say if you get three GREEN mylar caps mount them on the rar of the chassis. My kit did indeed have the three GREEN Mylar caps, but they are only 1/4 inch tall so they can be mounted on the front side of the PC board.
Before I started I scotch tapped all the resistors, caps, and diodes to sheets of paper grouping them according to value. I took an hour doing this and it really paid off when needing each part. It was super easy finding them. I initially tapped them to make sure I had no missing parts. (Only thing missing were the 4 knobs).
I had some spare time a couple days ago, so I used it putting on the decals on the cabinet. (Doug gives you two sets). I screwed one label up as it slid off the paper when wet and doubled up upon itself. I lost another one in the trash as I cut it off the sheet and it fell in the trash can. I didn't try to find it. So all in all, I had to use two of the labels off the back up secondary label sheet. The cabinet came out looking very nice. (I did spray it with Kyrlon Mat Clear Finish to protect the decals. After a few days I'll apply some paste wax to it too.
My kit came with two SA602 8 pin ICs rather then the SA612 ICs. (Almost the same thing). They can be interchanged.
When you do some testing, you need to apply power. You are told to hook the power to the PC board near the ON-OFF switch. I was careful to do this and not block any parts/wire holes as they are hard to clean out when you really need them for a permanent part or wire.
When you build T1 and L1, you put on 40 turns on L1 and 40 turns on the primary of T1 and 5 turns on it's link. There is no mention on spreading out the turns or lumping them together. (Knowing a little about something can sometimes get you into trouble). You don't have the turns lumped together or spread out as the number 30 wire will totally fill the core on both cores. (There is no option to spread out the turns or not spread them out).
So far, the instructions are very good. I have had no problem with them. Until mounting T-1, I would say anyone, even a novice builder could put one of these rigs together. T-1 is a little tough so maybe this is not the best rig to build if you have never built a kit before. Most kits explain what one turn consists of, when winding toroids. This kit assumes you know how to wind and count turns on a toroid winding. (The rule is, every time a wire passes through the center hole, you have wound a turn on the core). Experienced builders know this but probably not a new guy.

For new guys. There are three sizes of wire in the kit. The higher the number, the smaller the wire size. Number 30 wire in the kit is the smallest wire supplied in the kit. (Use the wrong wire on a 40 turn core and the wire wont fit).
Parts are very close together but the solder masking really helps insure you won't have solder bridges. With parts this close, you want to have good soldering skills. Also, use a good grade of solder. I'm using Kester rosin core number 44 with a diameter of .025 inches
My Almost All Digital L/C meter sure is nice to use when your eyesight is not what it used to be. I was able to confirm what part I had in hand very easily with the L/C meter.
Nothing else comes to mind right now. More to follow. This is a really nice kit. I did place the PC on the front panel, and it fits like a glove. The cabinet is precision punched.

2597. New Kit - Missing Parts, Errata

Yahoo group: pfr3_group
Date: 2011-06-20 14:25:13 UTC
From: kybarney
Topic: 2597 Message: 2597

Hi everyone,

I am a new kit builder and am starting on this kit. I sorted all the parts into a tackle box and noticed I am missing a couple of resistors from the inventory sheet.

Also, it looks like the 8 PIN DIP IC has a differenet part number than what the inventory sheet has.

I can't tell the value of the (4) glass diodes, but I assume they are correct.

Have any of you had these issues? I think the parts would be replaced with a phone call, but thought I should be working from an updated errata, if there is one...

I don't want to start soldering unitl I know I have all the parts in order...

Any other suggestions for things to watch out for are appreciated...

Thanks,
Kyle N9NJM

I got my kit about a week ago. It was missing a few resistors and
capacitors. The website says to e-mail parts@... which I did. I got
a reply that said they would send the missing parts.

Hope that helps,
Tom (VA2EPR)

Hi Kyle,

Good to be safe by checking first that you have all of the parts. Missing and/or extra small parts seems to be quite common with the PFR3 kits from the reports in this Group.

Which 8-pin DIP chips are you referring to? There are 4 in the kit. Lee reported that his kit came with two SA602 8 pin ICs rather then the SA612 parts. If that is your concern, no problem there as they are functionally equivalent.

The four small glass diodes are the 1N4148s. There is one larger glass diode which is the Zener that goes in the PA section.

Best of luck building our kit. We look forward to your reports.

Hi everyone,

I am a new kit builder and am starting on this kit. I sorted all the parts into a tackle box and noticed I am missing a couple of resistors from the inventory sheet.

Also, it looks like the 8 PIN DIP IC has a differenet part number than what the inventory sheet has.

I can't tell the value of the (4) glass diodes, but I assume they are correct.

Have any of you had these issues? I think the parts would be replaced with a phone call, but thought I should be working from an updated errata, if there is one...

I don't want to start soldering unitl I know I have all the parts in order...

Any other suggestions for things to watch out for are appreciated...

2600. PFR-3 and K42 keyer

Yahoo group: pfr3_group
Date: 2011-06-20 14:57:32 UTC
From: Michael
Topic: 2600 Message: 2600

Hi all,

I have been trying to get my PFR-3 to interface with a K42 decoder/keyboard unit.

I have nice strong signals in the headphones coming from the PFR-3, but no joy when connected to the K42.

I can plug the PFR-3 into my computer mic jack and decode using several different software packages.

I can plug the K42 into the speaker of the computer and decode morse from online sources like websdr.org, or mp3 files.

But when I connect the PFR-3 to the K42, nothing. The only thing I see in the K42 documentation is that it >>only<< decodes a signal of 690hz. When the PFR-3 is centered on the incoming signal and is coming through loud and clear, what is the frequency of the audio tone? Is there a way to change that incoming audio tone?

I'm trying to get ready for Field Day, to help my new club generate some extra CW points. They are pretty much SSB only. I'm also bringing my PSK20 for some digital points.

Thanks,

Mike KD0MEQ

Hi Mike,
The AT4 sends audio to a stereo plug, and wires the tip and ring together, for the mono output. With some external devices, that puts the audio output shorted to each other, and nothing actually appears at the input to the external device.
I don't have a K42, so this may be all way off base. Are you using the same cable to connect to the K42 in each case, i.e. to the puter?
The filter in the AT4 is usually set up for psk decode, during the calibration phase of the build. It can be changed, but even without the recalibration, the AT4 will rx a 690 cycle tone, it just won't match the sidetone exactly when you go to tx. The rx tone for the K42 would be a bit higher in tone.
Could it be that the AT4 has the ring of the jack wired to ground?
Interesting challange, that,

The audio filter in the PFR-3 should peak at about 600 Hz. If its a PFR-3A, then it peaks a little over 700 Hz.

Basically, tune in a station, then readjust the BFO trimmer until the decoder starts to work. The signal will be out of the pass band of the audio filter by a bit, so the signal will be down a little, but probably not enough to make much difference.

From: kybarney
Topic: 2597 Message: 2603

Steve,

Thanks for your response. I did receive part # SA602AN instead of SA612AN. I also did not receive the 47K or 22K resistors. I'm only a third of the way done with my inventory too so there may be more parts missing.

Is there a comprehensive errata published that details out some of the gotchas...like equivalent parts being shipped. I am new to kit building so I would have never known this. Or, is the errata on the Hendricks website the best one to use (about 5 items listed on it).

Thanks,
Kyle

Kyle,

To the best of m knowledge, the errata sheet on the QRPKits.com site is the only one.

It would have been nice for them to drop in a note in telling of the substitution of the SA612s. That's something only an experienced builder or experimenter would know about.

Fortunately, so far the omissions and substitutions have been quite minor and I've heard no reports of any of the uniquie components missing.

2605. Re: [pfr3_group] PFR-3 odd-harmonic side tone

Yahoo group: pfr3_group
Date: 2011-06-21 00:24:09 UTC
From: lahagar1@aol.com
Topic: 2600 Message: 2605

Dale,

This might be a bit off-topic but the PFR 3A side tone is not a single note sine wave. I measured it and found that it has a complex tone consisting of at least four partials, i.e. four audio frequencies. I found only odd partials and figure that might be due to computer generated square waveform. Anyway, on mine it is essentially comprised of the following frequencies, give or take a Hertz, with a 590 Hertz fundamental and several harmonic odd partials:

590*1=590 Hz
590*3=1770 Hz
590*5=2950 Hz
590*7=4130 Hz

The second of those, 1770 Hz, has the highest amplitude. I prefer a single note sine wave side tone as in the T1300's, but the odd-harmonic side tone of the PFR 3A is OK, just different.

From: Felipe Barco
Topic: 2609 Message: 2609

Hello, again!

My PFR-3 is ready! YEY!

But my power output is very low.

The PFR-3 gives me 1.5W on 40 and 30 meters. And 2.5W on 20 meters. One thing I noticed is that if I keep sending continuously in Straight mode, it goes, very slowly, to 2.0W and stops.

I'm using a 15W Dummy Load I built and a Voyager SWR-3P as Power Meter and SWR Meter. I know its junk, but that's what I have.

I counted the turns on the Filters, and and all six seem to be correct!

Can anybody give me a hint on what I can be doing wrong?

Thank You!!

Regards

Felipe - PU2OVA

Felipe,
With the radio in tune position does the LED come on?
With the radio in operate mode does the LED come on?
If the dummy load is good you should not see any led light up in tune or operate mode.
Make sure you have it set to the COAX position.
Did you try hooking up an antenna to see how well it receives?
Peak the receiver then tune the tuner for max RX noise or a station you may hear.
Make sure both band switches are in the same position.
I don't have a schematic but the power you give tells me that you have some sort of thermal problem.
Have you tried the SWR meter on any other radio?

Hello, Bob!

In Tune Position, the LED comes on.
In Operate Position, the LED stays off.

Due to weather conditions, I had some trouble with my last antenna, reason why I haven't tried it yet. But I get some hiss and outside interference.

The band switches are in the same position.
The SWR Meter is new, so I haven't tried it on any other radio. But, in SWR mode, it gives me a nice reading. I have 1:1 on my Dummy Load. The reading changes, of course, if I turn the switch.

I'm sorry, but what do you mean with Thermal Problem?

Thank you!

Felipe

Thermal as in heat build up.
Something get heated up to a point then the power stops dropping.
I just checked my rig and with a dummy load in tune position I have no LED and the same in operate mode
OK you have a 1.1 to 1 SWR but it changes when you turn a switch.
WHAT SWITCH ARE YOU SPEAKING ABOUT?

It's a SET & Field Strenght Adjustment.

It's a Variable Capacitor, I guess. If I let it to SET, my SWR is minimum.
If I start rotating it, SWR gets sky high.

I wonder why my led goes on in Tune.

I must say I'm doing the tests with my cabinet open.

I noticed this:

In Tune Mode, the LED goes on, ok?

In the 40 Meters, the LED is dim, and I have 1/4W.

In the 30 Meters, the LED is stronger, and I have a little less then 1/2W.

In the 20 Meters, the LED is very bright, and I have 1/2W.

You have me confused now
I think your saying you have a cap in your SWR/meter device.
It will go sky high.
You calibrate the SWR/POWER meter,then switch from power to SWR and you
should have a zero SWR into a dummy load.
I will check my other dummy load that I made back in 1980
Be right back

felipebarco@... writes:

It's a SET & Field Strenght Adjustment.

It's a Variable Capacitor, I guess. If I let it to SET, my SWR is minimum.
If I start rotating it, SWR gets sky high.

I wonder why my led goes on in Tune.

I must say I'm doing the tests with my cabinet open.

Yes,I have zero SWR when I go from PWR to SWR.

Steve, I'll answer your questions about Current in a Sec. About the power:

40 Meters: 1.5 and 1/4W
30 Meters: 2.something and a little less then 1/2W
20 Meter: 2.5 and 1/2W

All of this are Oper and Tune power outs.

OK Sorry but my mistake
I have the led very bright in tune setting
Then in all three bands in operate mode I have a bit over 5 watts and no LED not even the slightest dim LED
I did this with a 12 volt external battery then tried 2 different meters and my QRP dummy load and a QRP dummy load.

Yes. All in Tune mode.

In the 40 Meters I start with around 1.5W, going up slightly until it
reaches 2W. So, the Multimeter reads 26uA when I start to transmit, and
grows with power, until it reaches next to 30 uA.

I'm using a 12V external power supply.

Hi Felipe,

Well, you won't get the power output you're measuring if the current being consumed is either 26/30 uA or 26/30 mA. That would equate to either .00032/.00036 Watts input or .32/.36 Watts input. So either your meter isn't set up properly (I'll assume that it is working OK) -or- your Wattmeter isn't indicating properly.

What we're looking for here is whether the power input is in the ballpark for 4-5 Watts input or if it's low.

What brand and model SWR meter are you using?

73.......Steve Smith WB6TNL

Topic: 2609 Message: 2629

Felipe,

OK! Now we're getting somewhere! .620 Amps at 12V is 7 Watts input! That means that the BS170 transistors are making full power. On 40 your current measurements indicate 5.5 to 6.25 Watts input. You will notice that the ratios of pin to p/out track fairly closely on both bands. If it was an output filter problem I would expect those ratios would much different from each other.

I suspect a problem with the accuracy of your SWR meter. From what I have gathered on the Internet about that meter, it is primarily for 11 Meter CB. Those meters typically use a coaxial coupler line with simple loop-coupled diode detectors. They are only accurate over a narrow frequency band and are most sensitive at the high end of the frequencies they are designed for.

So, my conclusion is that your PFR-3A is working properly but the SWR meter cannot properly display the actual power output

With not too much difficulty you could change the pickup/detector circuit to either a Bruene or a Stockton circuit either one of which is very accurate over the 3 bands of interest.

Hello Felipe,

One more suggestion:

If you don't already have one, I recommend that you build an RF probe such as the one described here:

http://www.prismnet.com/~n5fc/rfprobe1.htm

With this probe carefully assembled, a good dummy load and a bit of math you can closely determine your power output. It's a great little piece of test equipment.

You could still use your Voyager meter for SWR. As long as you can get a full-scale ("Set") indication then the SWR reading will be accurate.

2631. Attaching L1 and T1

Yahoo group: pfr3_group
Date: 2011-06-21 06:19:26 UTC
From: lee
Topic: 2609 Message: 2631

I mounted L1 and T1 as indicated in the manual. That is, in a vertical position. The only thing holding them to the PC board are the winding wires. This is not very secure for a “portable” radio. I am assuming past builders have “tacked” the coils down in some form with either “beeswax” or maybe even an aquarium silicon sealer which gives off no acid to affect the wire. Is this what you guys have done? The manual makes no mention of “tacking” them down. I can’t imagine leaving them “floating”. If the wire holes were a little further apart, the wires would have secured the core to the board more securly. However the wire holes are so close together, not much stability is rendered to the core by the wires.
Just curious what others have done to their radio. I am leaning towards a few drops of beeswax between the board and cores. (I realize those cores with heavier wire standing upright would stay in place better and there are some of those in the output filter. However, L1 and T1 use number 30 wire which is not as strong. Also cores held in place horizontally would have no stability problem either).

From: Michael
Topic: 2600 Message: 2636

Lynn,

The multi-tone audio makes sense as to why the K42 won't decode. The documentation is very specific as to only decoding 690hz. Barring any simple way to change the output of the PFR-3, I'll just have to look for other solutions to decode. I suppose I could use my PC until I get up to speed.

I like your videos. They were a large part of the reason I bought a PFR-3 kit.

The multi-tone only applies to the side tone, not the received audio. The only issue the K42 would have in decoding the side tone is the fact it does not have a 690 Hz fundimental. The K42 implements a fairly narrow DSP filter centered at 690 Hz, which is the result of the the cpu clock frequency and other software constraints, due to the decoder being implemented using a general purpose uP, not a actual DSP chip.

Mike,

As Steve said, the side-tone audio doesn't affect the receiver audio.

Try adjusting the received signal using the RIT to change the audio pitch until it matches that needed by your decoder (~690 Hz). That won't affect you transmitter frequency, and QSO would be conducted in a normal manner after you set the RIT. I checked the pass band, and at least on mine you can copy just fine with RIT offset and 690 Hz audio on the received signal.

No, you won't be decoding your side of the transmission, but that shouldn't be a problem. since you know what you are sending ;-)

Thanks for comment on videos, I am a huge PFR 3 supporter! And Steve, thanks once again for designing a superb radio!!

Hello all friends list
I do not think I know the K42
Or I can be seen, but I do not know the manufacturer
Perhaps the pfr3 have a place in his chain of transmission or it would be possible to modulate the FM? In writing this I think naturally frequency shift especially in BPSK, I'm just asking, because in some cases it is possible to modify the transceiver for this?
It would be really interesting because there is the very good NuePsk not much bigger than him, I can tell you it works very well in portable QRP.

Subject: [pfr3_group] PFR-3 and K42 keyer

Hi all,

I have been trying to get my PFR-3 to interface with a K42 decoder/keyboard unit.

I have nice strong signals in the headphones coming from the PFR-3, but no joy when connected to the K42.

I can plug the PFR-3 into my computer mic jack and decode using several different software packages.

I can plug the K42 into the speaker of the computer and decode morse from online sources like websdr.org, or mp3 files.

But when I connect the PFR-3 to the K42, nothing. The only thing I see in the K42 documentation is that it >>only<< decodes a signal of 690hz. When the PFR-3 is centered on the incoming signal and is coming through loud and clear, what is the frequency of the audio tone? Is there a way to change that incoming audio tone?

I'm trying to get ready for Field Day, to help my new club generate some extra CW points. They are pretty much SSB only. I'm also bringing my PSK20 for some digital points.

Thanks,

Mike KD0MEQ

Hmm, no, you do not need to insert U8 (I didn't), and the display should
behave as described in the smoke test.

ciao,
Carlo

Carlo, Thanks for the info. Any ideas why mine isn't doing what it should? I have resoldered all the joints on the underside of the board so they should be good. All components are in too, except for U8. And if I press the up and down switches, the display doesn't change (but not all the digits are lighting up, only some of the parts of each).

2646. Re: Group I test and U8 and "plated through holes"

Yahoo group: pfr3_group
Date: 2011-06-23 16:30:36 UTC
From: Rick Dwight
Topic: 2641 Message: 2646

Grant,
During a PFR3 build about a month ago I accidently also found a plated through hole which was not. This was before a component was installed, so I simply made sure of a good solder connection. I did not write down where this hole was and I do not even remember where on the board it was. I did not have any problems with the build so I simply dismissed this as an isolated "glitch". So check this possibility out carefully. Please double check that your supply voltage and the voltage out of the regulators is in spec. The PFR which I built for a ham an AZ is now in AZ, but I would think that the current draw should be quite low for the group 1 tests....probably <30 ma or <<30 ma.

Kyle,

Well, if you get a frequency counter then you have to worry about that being calibrated :-).

Just follow the instructions under "Beating to WWV" on page 10.

Zero beating to WWV really isn't all that difficult if you have a 10 MHz 2nd receiver with an 'S' Meter. When the zero beat gets down below audible and near a few Hz you can 'see' the beat on the S-meter. Just continue to adjust until the movement of the S-meter slows to zero or as close to that as you can get it. Actually, many times you can hear the 'swish-swish' sound of the beat in the monitor receiver when it gets down to a couple of Hz.

Best of luck.

2653. Re: [pfr3_group] Re: Group I test and U8

Yahoo group: pfr3_group
Date: 2011-06-24 00:06:37 UTC
From: lee
Topic: 2641 Message: 2653

I found out awhile back while building other kits, the same type problem with bad thru hole jumpers when building up a multi-layer PC board.. I initially never used long enough heating of the joint point to allow the solder to flow thru the hole to the other side. I now hold the iron in place just slightly longer and allow solder to flow thru the hole to the other side of the board. If you have done this, you will notice the opposite side does indeed have solder on it. It does not take but a very short more time and feeding of just a little bit more solder for this to happen. Before doing this I never saw solder coming thru the hole on the other side of the board. Insuring solder flows up the wire and thru the hole will solve any thru hole manufacturer connection problems.

Since doing the above, I have found it totally unnecessary to solder both sides of the board.

Lee, w0vt

Thanks Dale, Now I need to fire up my iron with the ultra thin tip (the one I normally use for surface mounted components). I'll add a small drop of solder to the leads on the top side of the board, starting from the ones nearest the display and report back.

An update. I have soldered just about all the holes on the top of the board in Phase 1 now and it has made no difference. Must be something more sinister. I'll see if I can get a fresh, more experienced, set of eyes to go over it now as I have drawn a blank. You know, when I read in the instructions that nothing much can go wrong with this phase, I think, 'they don't know me. If something can go wrong, it will.' I need to sort this out before moving on to phase 2.

Hi Grant, Ok, do you have dc voltage readings for the display? Maybe we can find it with dc tracing?

Is there a small possibility that one of the pins has bent and not gone into
a socket pin?

Hello "in passing"
Yes, a little dangerous soldering iron, especially when one soda under a large magnifying glass ...
Sometimes there are things beside risking their lives as it is iron, the vision is not the same around, it must be very careful.

Good Luck Grant, just be mindful of the rest of the iron, besides the tip. It melts the oddest things, while you are focused on solder melting.
That is said, cause I just did that... but that is another story,
Have fun,
Let me know how it goes, please?

Also, I's suggest a careful inspection of U7, to make sure that the
socket has no unsoldered pins, that no pins of the IC are bent or not
making good contact, and so on.

ciao,
Carlo

Hello Carlo
Indeed, I have not received my pfr3 can be shipped from the 20, but I carefully read the adventures of the friends list.
Maybe it is good also to look carefully at the printed circuit board under the microscope before starting the installation,
and can control whether the cross-plated holes in good condition and well étammés.

I remember one display that did give me a fuss about getting all the pins in the holes... and there was one that wanted to be put in upside down.That was fun to fix... it didn't light up right at first either. Upside down is a tuff deal.

Jean Paul,

I received my PFR-3 on Thuesday afternoon and I'm almost finished with the
build. So far everything went smooth, except for a bunch of minor things
that I'll post to the list as soon as the build is complete. I'm winding T3
right now, then I'll place the decals on the enclosure and finish up the
whole thing, but that will be by Sunday evening I think.

ciao,
Carlo

Jean Paul,

in fact I did a lot of "welding" also at night :-) I got very little
sleep since when I got the PFR-3 delivered, yet I tried not just to be
fast but also to make an accurate job, and I think I managed. I did a
number of small mechanical modifications with respect to the original
plan, and I must say that it paid back. I have just finished, and the
unit puts out approx 6.5 watts on 40m, 6.1 watts on 30m and 6.9 watts
on 20m with 13.5Vdc power supply. I tried to reduce those values closer
to 5 watts by squeezing a few turns on the low-pass TX filter toroids,
but that resulted in even more power (!), so I left the turns evenly
spaced around the core, the way I had originally put them. The finals do
not seem to get significantly warm even at those power level, yet I'll
install a small heathsink just in case.

Now I'll take a break and mow the lawn :-) and this evening I'll get
to the decals.

ciao,
Carlo

I bought a cheap fc kit a few years back (Norcal?), and it has served me well over the years. I built mine into a matchbox. It works great, and will only set you back 30 or 40 dollars. It's a good station accessory to have, so the investment is a sound one IMO.

The finals are not very tolerant of mismatches, and will become very unhappy, if they are asked to tolerate high swr for a longer than neccessary period.They don't generally exhibit their unhappiness by heatug up, they usually just quit.

Yes, it is recommended that you do not exceed 12 volts. Since this rig was designed for battery operated, portable use, it was designed to output 5 watts with a 12.0 volt supply.

As noted, it will put out over 6 watts at 13.8 volts, but one runs the risk of burning up the BS170 if the SWR gets just a little out of hand. This is because when the SWR goes up, the BS170's draw more current and that is what burns them up, exceeding thier current rating. It's not the heat which gets them, it's the excessive current.

That's why if your going to run the rig on a 13.8V bench supply, I recommend dropping the voltage with a couple of series connected silicon rectifier diodes, in series with the supply line.

72, Steve KD1JV

But I thought it was absolutely necessary to not exceed 12 volts? Is probably because of that there is too much power ...

Steve,

yes, mine was just a "smoke" test, with no smoke fortunately :-) Also,
that was with a 50 ohm dummy load so SWR was 1:1. Normally I'll be
operating the rig on on 8 x 1.2 HiMh AA cells, so that should be well
within the rated specs.

good evening to all
I am amazed at the great performance of this transistor
there is no bigger than a 2N3904 and can produce nearly 2 W HF, I think I will carefully study the diagram
and replace the power transistor in an assembly that comes with a little power 2N3866 (not even 1 W)
It is a good example of a mounting very well studied,
I'm just in awe, the schematic of the PA output part is no ordinary ...
I must buy some transistors BS170 if I find a seller here ...

The finals are not very tolerant of mismatches, and will become very unhappy, if they are asked to tolerate high swr for a longer than neccessary period.
They don't generally exhibit their unhappiness by heatug up, they usually just quit.

Well Bravo Carlo
But I thought it was absolutely necessary to not exceed 12 volts? Is probably because of that there is too much power ...
Maybe the output transistors are very strong
Only 3 BS170 ... Hmm I think it would be good to put a good cooler on these small transistors,
I know they are MOS with a very good performance, but I am a bit surprised

Jean Paul,

in fact I did a lot of "welding" also at night :-) I got very little sleep since when I got the PFR-3 delivered, yet I tried not just to be fast but also to make an accurate job, and I think I managed. I did a number of small mechanical modifications with respect to the original plan, and I must say that it paid back. I have just finished, and the unit puts out approx 6.5 watts on 40m, 6.1 watts on 30m and 6.9 watts on 20m with 13.5Vdc power supply. I tried to reduce those values closer to 5 watts by squeezing a few turns on the low-pass TX filter toroids, but that resulted in even more power (!), so I left the turns evenly spaced around the core, the way I had originally put them. The finals do not seem to get significantly warm even at those power level, yet I'll install a small heathsink just in case.

Now I'll take a break and mow the lawn :-) and this evening I'll get to the decals.

ciao,
Carlo

Does it matter if the what direction the yellow capacitors are installed? Does the printed band (104) need to face a specific direction? I can't tell from the photos...

Thanks,
Kyle N9NJM

No, not at all. Personally I prefer to orient them in a way that I can
see their value even once they are surrounded by other components, but
that's absolutely not necessary.

ciao,
Carlo

Kyle,
The only ones that make a difference are the electrolytics - the "cans".

The others it doesn't matter.

I've tried to remove the kink from the yellow capacitors, but should they still sit up off the board a little bit?

As for operation, the caps can face any way they fit. And they don't have to be smushed down flat on the board. However,I face all the caps the same direction, that makes trouble shooting so very much easier, and for appearance and stray stuff elimination,all of them sit very nearly on the board. Isn't it a blast building?Have a great day,

I generally avoid stressing the leads of those tiny capacitors any more than is necessary. Unless there is some sort of clearance or spacing problem, I leave them as-is, insert and solder 'em.

But what to do with all those pesky leads sticking down from the bottom of the board? ;-)

I have a few other general questions:

1. I was able to get the yellow caps flush with the board...hope that's not a problem.

2. The brown caps will not sit flush to the board. I cracked a couple of the cases around the leads, so I sealed with epoxy (super glue). Any issues there? I I need to replace them, can i get them at radio shack?

3. For LM805, why are the holes not drilled on the board in a singular row....that's how the leads are formed. I am soldering the center pin in the front towards the flat side, and not mounting it flush to the board since it will crush the front pin (I think). Is this correct?

4. Some of the green laminate has bubbled on the PCB, you can tell under the magnifying glass. To the naked eye, it looks like light smears or glue. Can I clean that up with rubbing alcohol or something else? I was scraping at it with a pic and it seems to clean somewhat. Is that type of damage to the board catastrophic in the long term? As my soldrering gets better, there's less of those areas :-) I am also using the right size tip now...

Thanks for all your help.

Hi,

1.) It's not a problem, just not necessary.

2.) That is exactly what I meant by stressing them. They'll probably be OK. I'd just leave them alone and continue on. From now on just don't press them down to the surface of the board; it's not necessary.

3.) Assuming you mean the 78L05, that would be the correct procedure. Simply press the part down toward the board untill there's some resistance. The bottom side of the part will end up approximately 1/8" off the board.

4.) That is the board coating. I'd leave it alone. It is likely -not- catastrophic. If you scrape it or clean it with alcohol it might completely remove the coating and expose the PC board traces. From your description, you are heating the solder connections too long. What are you using for an iron?

The PFR3 is not a good kit to learn soldering on. But it has been done! Just be careful, don't get in a big hurry, follow the instructions as written and you'll do just fine.

OK. Hard to go wrong with a Weller.

QRPKits changed parts and/or vendor for the jacks and they do not properly fit the PCB holes. -Don't- hog out the circuit board hole. Best thing is to crimp down the pin so it fits the hole. I think there are photographs for that, maybe in the Photos section of the Group site.

Best of luck with the rest of the kit and keep us posted on how you're doing.

The one thing I can't check are the thru holes of U7. I can verify that the IC is firmly in the holder and that none of the pins are bent. But how to check that the thru holes are OK?

Seems to me that either one of these hidden holes is the problem or that there may be a faulty component.

HI Kyle, this is about what I got too. I have resoldered all the components again as well as on the top of the board to make sure there isn't a bad thru hole somewhere. I replaced C50 as I couldn't get the iron to it from the top and all this made no difference. Also when I hit the up or down switches I see no change in the display. I am still hunting for a fix.

Dale these are the voltages, read with the board upside down.

Row with the link fist left to right:

3.92
2.89
0.01
3.19 (link)
3.19 (link)
2.89
1.97
0.01

Top row, left to right
0
4.94
4.94
3.55
4.94
4.94

I am using a battery with 10.58V

Regards
Grant

I initially never used long enough heating of the joint point to allow the solder to flow thru the hole to the other side. I now hold the iron in place just slightly longer and allow solder to flow thru the hole to the other side of the board. If you have done this, you will notice the opposite side does indeed have solder on it. It does not take but a very short more time and feeding of just a little bit more solder for this to happen. Before doing this I never saw solder coming thru the hole on the other side of the board. Insuring solder flows up the wire and thru the hole will solve any thru hole manufacturer connection problems.

Did you by chance get 2 14 pin dip chips? I did, and I installed the one that is hollow in the center, but he picture has a chip that is not hollow.

Any chance you have the same setup?

The ic, I think you are referring to, is the one that is - ATMEGA48, and in one manual it is U6, in another is it U7, the U8 is a 14 pin - 74HC02.The "hollow through the center" confuses me, does it have a number on it?Some of the ATMEGA48 ics had yellow dots, some didn't.

I am referring to U8, which is 74HC02. I have a hollowed out 14 pin chip, and a solid 14 pin chip which is 74HC02. I installed the hollow chip, not 74HC02. I thought that could be the issue. I am guessing they are similar parts, but both were accidentally included in my kit... I am not sure.

No, there's no part number on the hollow chip...it just says, "AMP" on one side, and "14" on the other.

Also, I was wondering if you installed R40 and R41 color bands backwards, per the photo...?

2694. I found a base coil loaded telescopic antenna. I just put it on the pfr3 and stations are coming in-. good considering I'm indoors and no counter poise wire. Tomorrow I will give it the outdoor test. I got the LED pretty dim

The "hollowed out" chip is a socket not an IC!

From: Grant
Topic: 1261 Message: 2698

I have taken voltage readings of the pins of U7. Read from the top of the board, left to right:

Top row: 0, 4.92, 4.97, 0, 4.97, 0.01, 0, 4.97, 4.97, 4.94, 4.94, 2.00, 4.94, 4.94
Bottom row: 4.97, 2.97, 1.98, 1.00, 0.01, 0.01, 4.97, 0, 1.01, 1.01, 0.01, 1.97, 3.92, 1.01

Supply voltage 10.42v

Regards
Grant

Grant and Kyle,

Do the freq. up/down buttons have any effect on the LED segments?

If not, do different LED segments that were illuminated/extinguished change state after you power off, wait 15 seconds, then power back on?

This is starting to sound like possibly an un-programmed, mis-programmed or bad U7.

I agree Steve, with hopes for the U7 simply not getting connected correctly... but that is a real reach at this point.

Steve,

The freq up or down buttons have no effect on what's shown on the display. Not even a blink.
After 15 secs the same segments light up. No change.

You're right Dale, it only takes one critical socket pin mis-soldered or U7 pin not making contact to hose everything up.

I'm surprised we haven't heard of any IC pins folded-over. But that's never happened to me..........riiiight.

Thanks for that info, Grant.

I'm guessing an un-programmed U7 (those things almost never go 'bad').

Does yours have a paint dot on it?

I'd say that with a paint dot on it, the probability is good that it's been programmed.

My opinion is that before you ask QRPKits for another uP you should email Steve Weber to see what he has to say about the problem and what further tests he might recommend. In the email, send him any measurements you've made.

If you decide to request a replacement U7, use the <parts@...> email addr..

Different LED's light up when I power on initially. Those go out, and only a few are powered on after that test.

I removed U8 and replaced with the solid part that matches the picture. A few more LED's come on now, but still not right.

The tune buttons have no effect on the LED display...

Hi Kyle,

Does your U7 have a paint dot on it?

From your description, it sounds as though your U7 is at least initializing. The initial display (for about 1 second or so) is the power-on LED segment test. After that the display changes to what is supposed to be the frequency readout. Those changes indicate to me that U7 is running.

It's possible that U7 is 'outputting' the signals for the display segments to change but some of the signals are not getting there. Try holding the Up or Down buttons longer or try changing bands or operate the bandswitch, S6, to see if any segments change.

Except for no apparent response from the Up/Down buttons, the problem sounds like connections from the LCD to U7 -or- a bad display but you can perform some additional tests to clarify that.

Try the second to last step in Group 1 tests; the RIT PB switch. See if that lights and extinguishes the leftmost decimal point LED in the display. Next perform the DDS frequency test, the last step in the Group 1 smoke test: Power off. Set the bandswitch, S6 to 40 Meters. Power on without touching any buttons. Using a freq. counter or local receiver, if you get 11.9452 MHz (+/- 1 kHz) then U7 is at least running and 'telling' the DDS chip what to do. If it is not running, I'd suspect either solder problems around U7 or a bad U7.

Remove U7. Check for folded-over pins on the IC. If OK, leave U7 out of socket and, with power completely removed, use your Ohm meter to check for continuity from each of the eight U7 socket pins to the corresponding pins on the display. Measure from the socket itself (top side) to the display pins on the bottom. You can make a probe from a scrap of cut-off resistor lead. You should see the 2.2K resistance from the current limiting resistors on -each- of the eight socket pins to the display leads. Any significant difference means a problem. If you see good continuity as described above, then it's likely that the display is bad.

Hi Grant,

One more thing to look at. Make sure everything's OK with C30. I think it pulls down the U7 reset line at start-up. If it's open, the uP may not start up. If it's leaky or installed reverse-polarity, funny things could happen too (until the capacitor blows up). :-O

Steve,

Yes, U7 has a yellow dot on the left, near the notch on the left hand side.

I haven't built the bandswitch yet, I am still in phase 1. Ha!

Holding the up/down/RIT buttons don't do anything to the display.

I know U7 does not have any folded over pins because I can see all of the pins protruding from the solder on the other side of the board..

I checked U7 pin voltages, and they are as follows:

View from top side of PCB:
Top row voltage: 0.0/4.92/4.97/0/4.97/0.0/0.0/4.97/4.97/4.78/4.78/2.00/4.78/4.78

Bottom Row: 4.97/2.97/1.98/1.0/0.0/0.0/4.97/0.0/1.01/1.00/0.0/1.97/3.94/1.01

Thanks Steve. All I can realistically test (as far as I know) is the polarity by looking at it. C30 is in the right way. And it is a 100 ufd cap. Can't test that it is good though as I don't have a meter. Anything else I could do to verify its state?

Hi Kyle, I get just about exactly the same readings as you do for U7. And holding down the buttons also do nothing to the display.

Hi Dale and others
I think this solution is good and easier for everybody.
all capacitors have with writing in the same direction, eg left, and the resistance read from top to bottom, can be an advantage for research and the proper reading of visual editing, it was recommended years ago is logical and much better than putting the components in all directions, I always do well in all my fixtures.
unless the models are biased or have no choice ... H.I.
Professional builders are implementing in this way generally.

Subject: RE: [pfr3_group] Re: Capacitors

As for operation, the caps can face any way they fit. And they don't have to be smushed down flat on the board. However,
I face all the caps the same direction, that makes trouble shooting so very much easier, and for appearance and stray stuff elimination,
all of them sit very nearly on the board.
Isn't it a blast building?
Have a great day,

Hello everyone
Son in the solder, (especially new son without PB) flux remover is becoming worse now.
The solder flows well, and sometimes difficult to grip, the temperature is not the same, (400 ° C) and must be soldered very quickly.
I should have done the "hunting" the old welding wire before the change, because we can see the results very bad, even some professional editing.
YL I know it was his job, and on the CMS surface, and hyper frequency, it has become a (big hassle)!
plux some special liquid made (just a drop) can help, or other stripper, but add very little on the circuit before soldering, it can help, just a needle product, and welded with iron very hot and very fast.
The worst is welded with a low temperature and longer than 5 seconds or more, are some of the damage ...
it is interesting for those who are not very confident to experiment on an old turntable, it's not a waste of time, there is nothing to be ashamed, it's difficult with some soldering son, and especially not to use several very different, it's a catastrophe!
it is very useful to test prior to fully know the right temperature and be absolutely certain of his welding.
Good luck to all
Jean-Paul F6DDV

OK. Hard to go wrong with a Weller.

QRPKits changed parts and/or vendor for the jacks and they do not properly fit the PCB holes. -Don't- hog out the circuit board hole. Best thing is to crimp down the pin so it fits the hole. I think there are photographs for that, maybe in the Photos section of the Group site.

Best of luck with the rest of the kit and keep us posted on how you're doing.

I am using a digital weller station I just bought. I put the rf probe together without a problem. I think I was just using too small of a tip.

Did you have a problem with the phono plugs for the key/headphones? The front pin is too big for the hole...

Jean-Paul,

I usually follow that rule with resistors, but not with the capacitors,
because they usually have their value marked on one side, and that may
become difficult to read if it faces a taller or close-by component. So
I prefer to orient each and every cap in a way that I can always read its
value even with the board completely assembled.

> Professional builders are implementing in this way generally.

I think that has more to do with the fact that automaded assembling
machines do not get into these considerations :-)

ciao,
Carlo

Hi Kyle,

Thanks for those measurements. I added them to my folder of troubleshooting notes.

The pins you see sticking out from the bottom of the board underneath U7 should be the 28-pin socket pins. I hope you installed the socket and didn't solder the IC directly to the board. The folded pin(s) I referred to would be underneath U7, between it and the socket. When inserting the IC it's easy to catch the pin(s) on the side of the socket and bend them. Sometimes it will look like all the pins are OK until the IC is removed from the socket. Sometimes an IC pin will miss the hole altogether and end up on the side of the socket but that is easy to spot; folded pins are not so easy to see.

Sorry for goofing up on the bandswitch. You are correct, it is not part of group 1. The rest of the troubleshooting procedure is valid. So check to see if you're getting 11.9452 MHz (+/- 1 kHz) from the DDS per the instructions and if that is working, do the continuity checks.

I inadvertently made the test procedure a bit unclear. I meant to say "check for continuity from each of the eight U7 socket pins that connect to the display"

Steve,

Yes, U7 has a yellow dot on the left, near the notch on the left hand side.

I haven't built the bandswitch yet, I am still in phase 1. Ha!

Holding the up/down/RIT buttons don't do anything to the display.

I know U7 does not have any folded over pins because I can see all of the pins protruding from the solder on the other side of the board..

I checked U7 pin voltages, and they are as follows:

View from top side of PCB:
Top row voltage: 0.0/4.92/4.97/0/4.97/0.0/0.0/4.97/4.97/4.78/4.78/2.00/4.78/4.78

Bottom Row: 4.97/2.97/1.98/1.0/0.0/0.0/4.97/0.0/1.01/1.00/0.0/1.97/3.94/1.01

Hi Grant,

Thanks for checking that.

Well, your U7 pin 1 voltage looks fine and it compares to Kyles U7 measurement so I would say C30 is fine. I was sort of grasping at straws on that one.

Thanks Steve. All I can realistically test (as far as I know) is the polarity by looking at it. C30 is in the right way. And it is a 100 ufd cap. Can't test that it is good though as I don't have a meter. Anything else I could do to verify its state?

Grant

Are U7 and U8 supposed to have the 14 pin and 28 pin dip sockets installed first, and then the chips insterted and soldered on top of those? If so, I messed up because I had the 14 pin socket installed in U8, and removed it (destroying it in the process) to install 74AC02PC.

Both 74AC02PC and ATMMEGA48 are installed and soldered directly to the board. That sounds like it's the problem. If that's the issue, I am concerned because I need another 14 pin DIP, and I don't think I can remove U7 and U8 without damaging them... :-(

If I am able to remove US and U8, which are soldered directly to the board (that's a big IF), would this radio shack part be a suitable replacement for the U8 socket I destroyed when trying to remove it?

Hi Kyle,

Oh, my. No, there's supposed to be a socket installed first. You can see it in the photograph of the board. See Pg. 6, the 6th 'bullet point' from the bottom.

Soldering U7 directly in won't stop the radio from working -if- U7 is OK. Plus, it makes it much more difficult to troubleshoot this problem.

Yes.

There should have been a socket for every IC in the kit. You should have the 28-pin and 4 ea. 8-pin DIP sockets left.

You can ask Doug Hendricks to send you replacement parts. His guarantee provides for screw-ups at no cost to you. All you have to do is pay the postage. See his web site for details: it's at the bottom of page 1 (the home page)

Hi Grant,

The reason I'm asking about the ~11 MHz is because if the DDS is not running that's a good indication that the problem is with U7 and not the display or the connections from U7 to the display. If the DDS -is- running and on the proper frequency then the problem is most likely related to either a bad display module or the connections from U7 to the display. That can be confirmed by doing the continuity tests and will rule out the connections to the display.

Hi Dale,

What do you think my next move is? Does it look like U7 is US? Incidentally, my board has two U8s marked on it but I'm sure one (the 28 pin job) is actually U7. Should I ask Doug to mail me a replacement? I don't have Steve Weber's email address to ask him about how to interpret the voltages I have on the display and U7. I hope he is following this thread.

Hi Grant, I'm curious, do you have a digital camera that you could take front and back photos of the board, and send them to me directly? The PFR3 I have on the bench right now had two U8s marked on the board, they both have sockets and one is the 14 pin, the other the 28 pin. U8 is the one closest to the tuner caps - c72/73 and C74/75. The other (28 pin) is U6. This is from the rev B.1 manual. In the PFR3A manual, U7 is the 28 pin IC. In your radio, the "notch" in IC7 should be closest to the jacks. There have been issues with U7 getting it plugged correctly into the socket, usually folding under a pin or two, as the ic gets pressed into place. And, there have been issues with the pins on the display doing the same thing, although that is easy to spot. Look on the other side of the board, and count the pins. Is there a pin in each hole for the display? I have had to get one new IC from Steve, and you may be ahead of the game, if you were to contact him directly, he's addressed on this email too. Give him your voltage readings, with an explanation of what all has been done, that may very well be the best way, Or, if you'd like, I'll work on it for you, no charge, just postage, either way, is fine. Have a great day,

I've been hitting the Just Learn Morse Code and G4FON software pretty hard but wasn't ready over the weekend to make contacts. One of our club members, Ken, was kind enough to give the PFR-3 it's inaugural run. He made several contacts, and said it sounded great! I think making CW contacts during the first few hours of FD when the bands are hammered proves to me at least it is a fine radio.

Here is a photo
<https://picasaweb.google.com/moody.michael/KD0MEQ#5622715453092789474>

Now I have even more motivation to get the rest of the letters I need learned and get on the air.

Hi Steve,

I have done the test and hear nothing. So I conclude that the DDS is not running. This evening I am taking the rig to an experienced op who will cast his eye over it too in case I have missed something. I'll report back when ready. He, incidentally is also building a PFR-3A; we ordered ours together.

I have just completed my unit, and it turned out a rather nice build.
With fresh internal Ni-Mh AA batteries I have measured these power values:

* 40m -> 3.5 watts
* 30m -> 3.0 watts
* 20m -> 3.8 watts

These values look much safer than those that I had measured at 13.5 Vdc.

In a few moments I'll post a summary of the minor glitches that I have
found with this otherwise excellent kit.

ciao,
Carlo

2748. my PFR-3 is complete and functional!

Yahoo group: pfr3_group

From: Carlo Strozzi
Topic: 2748 Message: 2748

Hi all,

I have just completed my own unit of the PFR-3 and the result is really good, electrically, mechanically and visually. I tried and apply every possible care in the process, which took me abt 30 hours from start to finish, spread over seven days. I have yet to test the actual matching capabilities of the built-in BLT on an externa wire antenna. I already own one stant-alone BLT+ tuner and it works well, we'll see how the built-in one works.

Here's a list of minor glitches that I have found with this kit, along with a few suggestions of mine for a successful build.

A number of (common) components were either missing, wrong/damaged or in excess, namely:

* my decals were for the PFR-3 as opposed than for the PFR-3A, but that is only apparent in the large label advertizing QRPKITS.COM so that was not a problem.

* one toroid T37-2 was broken, fortunately I have many spares here.

* two 220 Kohm resistors were missing.

* three NP0 47pF ceramic caps were missing.

* two SA602AN mixer ICs were supplied instead of the listed SA612AN; this is actually a good thing because the latters have better specs than the formers.

* only 4 x 1 Kohm resistors are needed, but the bill-of-material (BOM) says 5, and anyway 6 were supplied.

* n. 17 x 2.2. Kohm resistors were supplied, the BOM says 14.

* n. 5 x 4.7pF NP0 ceramic caps were supplied, the BOM says 3.

* n. 28 x 0.1 uF mono caps were supplied, the BOM says 21.

* a minor surgery was needed on the PCB to make the jack sockets fit in the relevant holes on the board. I preferred to do it like that instead of trimming the jack contacts because they are fragile, and they are already tiny enough. The surgery needs some patience, tools and expertise, not to remove too much of the hole inner plating.

Misc stuff:

On page 10, "IF offset adjust and BFO trimmer set:" the manual says you should see two peaks at the boundaries of the filter bandpass.

In my unit I had only one well-defined peak, but that may be because
I had carefully matched both the xtals and the caps in the filter
before installing them.

I placed insulating material under L7, T2 and T3, to prevent any
unwanted contacts with the underlying PCB. All the toroids were
fixed in place with a drop of epoxy.

I wound T1 with #30 AWG wire instead of the supplied #28, to make sure
the primary and secondary windings did not overlap. T1 is in the RX
section so no problem with using thinner wire there.

The nylon spacers used to extend the polyvaricon shafts were a bit too
long, resulting in the knobs standing a bit too high above the front
panel, so I shortened both the spacers and the screws by about 4mm
and in that way things looks much better. Once the nylon spacer are
tightened in place their diameter increases slightly, so that the knobs
have troubles in sliding over them. A tiny smear of silicon grease on
the top ends of the shafts fixed this. If you apply the same surgery
make sure that the spacers are cut perpendicularily, so that the knobs
remain axial during their rotation.

Although the finals do not need a heathsink I placed a small sheet of
copper over the heads of the three BS170, and glued it in place with a
drop of epoxy. In this way, beside the heath-sinking effect of the piece
of copper itself, the heath gets evenly distributed across the three
transistors, which I think may also help with keeping things cool.

I have installed a separate DC socket, connecting directly to the
internal battery pack, so that I can use a commercial quick charger
without having to remove the exausted batteries nor needing an internal
trickle-charging circuit. The extra socket is normally kept closed with a
difficult-to-remove rubber plug, so that it is not accidentally used to
connect an external power supply.

If the red acetate display protection is fixed to the front panel with
super-glue, then make sure the latter is of the gel-type, to greatly
reduce the risk of smears of glue on the exposed part of the protection
itself, which are then impossible to wipe off; it happened to me, and
even if the smear is not very visible it is still disturbing. Fortunately
it is completely invisible when the display is lit.

So, that's it. I'll post pics of the completed unit later on.

ciao,
Carlo

I have just completed my unit, and it turned out a rather nice build.
With fresh internal Ni-Mh AA batteries I have measured these power values:

* 40m -> 3.5 watts
* 30m -> 3.0 watts
* 20m -> 3.8 watts

These values look much safer than those that I had measured at 13.5 Vdc.

In a few moments I'll post a summary of the minor glitches that I have
found with this otherwise excellent kit.

Here they are, as anticipated:

Below is a top view of the board. Unfortunately it is out of focus but
I took it indoor late last night, and now it's too late to take a better
one because it has been wired inside the enclosure. However you can see
the heathsink on top of the finals, and the unsulators under those
toroids that lay horizontally:

http://www.strozzi.it/users/carlo/hamradio/pfr-3/epsn5144.html

The original paddles are no longer available with the kit, and anyway
I'm not sure I liked them all that much in the first place, so I
preferred to take a diffrent route:

http://www.strozzi.it/users/carlo/hamradio/pfr-3/epsn5197.html

Also, in some of the pics you may be able to notice that R14 has been
mounted on the bottom of the board, over SIP sockets. I did that to be
able to experiment with the sidetone volume even after the unit had been
assembled into the enclosure. That turned out to be unnecessary but
retaining that possibility doesn't hurt either.

That's all.

Carlo,my rig with new fresh energizer batteries has the following power out. 40 - 5.3 watts. 30- 4.8 watts. 20-- 5.1 watts. The readings were into a dummy load and loaded into the end fed wire,all bands were 4.8 measured on Weltz meter and a Diawa meter. I almost always operate from my station wagon and plugged into the cigarette lighter socket, the reading are all 2 tick marks higher since the car battery shows 12.66 volts right after shut down. So far I haven't tried it into the PAC-12 or the Budd stick but both of those are resonate so I expect they will work well if and when the sun wakes up. Tonight I will be on 7.025. And moving down and try the RBM with QRP to see where I'm being heard. Bob AF2Q

Bob,

those pwr levels sound good. I measured mine with a simple 50 ohm dummy
load and an RF probe, but I believe it still rather accurate. What type
of cells are you using ? Mine are Ni-Mh, for a total voltage of abt 10 Vdc
when freshly charged.

Carlos, no need to repost what you already have. I use new 2.8 mAh energizer batteries but even when I use the 10 pack my readings are always just about the same. Right now the nMh batteries are well drained but all 3 bands are showing just over 2 watts. Bob. AF2Q

Bob,

do you mean 10 x Ni-Mh cells ? Here I'm using the internal pack of 8
cells, which is well below 12 volts with Ni-Mh batteries, even when
fully charged. That's the voltage that gives me the power level that I
posted earlier.

That was a typo. The recharge pack is 10 volts but now run down still all bands show about the same power. With the 10 volt pack you should still get 4.5 watts on all three bands. Try checking it into a dummy load with a meter. Bob AF2Q

Dale,

thank you for appreciating :-) The pic of the top of the board is out of focus
but I took it late last night and I didn't realize immediately. Now it's
already been wired into the enclosure so it's too late to take a better one.
Never mind. All other pics were taken this morning in daylight, and the
difference is apparent.

ciao,
Carlo

Hello everyone
can not think that way.
what exactly is the voltage that is given to pfr3 with cell batteries? (without diode in series and without pressing the key in tune)
and what is the voltage that is given to tune in pfr3
And only then, what is the output power, and how many mA? With a load of 50 ohms 1 / 1 ROS
The RF power may be different, but also the number of mA.
only 05 volts, more or less can change everything
it goes up very quickly with the power volts.
And I have not talked about the balance of cells ... very important.

Bob,

those pwr levels sound good. I measured mine with a simple 50 ohm dummy
load and an RF probe, but I believe it still rather accurate. What type
of cells are you using ? Mine are Ni-Mh, for a total voltage of abt 10 Vdc
when freshly charged.

2772. Crystal Matching

Yahoo group: pfr3_group
Date: 2011-06-28 03:18:51 UTC
From: lee
Topic: 2647 Message: 2772

I finally got around to matching 4 of the crystals for my PFR-3. (You need 4 in the filter and 1 for an oscillator, for a total of 5 crystals. My kit had 6 crystals in the bag). I ran each of the 6 crystal for around 10 minutes each in my oscillator coupled to a warmed up frequency counter. After all was said and done, there was only a difference of 10 Hz between the highest and lowest crystal. With the 4 I picked for the filter, there is only a 4 Hz difference in frequency.

The bottom line is, I really didn't have to match the crystals. In my kit, and I can only speak for my kit, the crystals were so close together in frequency matching was really not necessary. I was thinking of buying a bunch of crystals if mine, supplied in the kit, didn't match very well. (Mouser has them for around 50 cents each). With only 4 Hz difference from lowest to highest, this was not necessary. The crystals supplied with the kit are very good. I have no idea if Doug matched them or not, but if he did not they are very accurate as is.

Reading all the traffic about possible bent IC sockets, I always use machine grade sockets with gold filling instead of the cheap "stamped" ones. The pins are round and very sturdy. There is very little chance of bending one of these pins when inserting them into a PC board. For the 28 pin socket, I just used two 14 pin sockets in series with one another.

I also found the two PC mounted stereo jacks pins were slightly two large for the holes drilled into the PC board. I elected to reduce the pin size of the jacks using a pair of diagonal cutters (sharp ones) instead of drilling out the holes. HERE IS WHY! In many cases, PC boards are multi layered. They are not always one sided or two sided but sometime multi layered. That is, there are traces in more then 1, 2, 3 or 4 layers within the PC board. (I suspect the PFR-3 is only double sided). When you drill out a hole on a multi layer board, you risk drilling out the thru hole trace connecting one layer of the board to another layer. It's not a good idea drilling out a PC board for this reason unless you know for sure you are not going to remove a thru hole trace by enlarging the hole. Also, drilling out a hole too much will possible cause the copper trace to get ripped of the substrate. If you are going to drill out a hole, make sure you use a small PC drill bit. (A 1/2 inch drill bit from The Home Depot is not a good idea)!

I did have some free time a few days ago and did label up my cabinet. It came out very nice. After spraying a matt clear coat over the cabinet a few times and allowing the clear coat to set up a few days, I waxed the cabinet a few times with auto paste wax. You can only faintly see the outer edge lines of the decals. (I did cut them very close to the lettering). When you slide the decal off the paper make sure the decal does not fold back upon itself and "double up". If this happens, you will never get it to open up and lay flat again. (It's a good thing Doug gives you two sets of decals).

My kit was only missing the 4 knobs and Doug got them to me post haste!

Now I need to install the crystal filter crystals and test out the receiver. (The receiver is built except for the needed filter crystals).

I do plan to install some home made heat sinks on the three BS 170s as done on the Fort Tut Hill 80 rig I purchased from the Scorpians. (Their heat sink is an aluminum plate and epoxied to the flat side of the BS 170s. This trick works really well. In the Ft Tuthill 80 rig the two BS 170s are epoxied to a single 1/8th inch think aluminum plate around 1" x 1/2" side bye side. For the PFR-3, I'll use 3 fairly thin aluminum plates with one glued to each of the three BS-170s. There is enough room between the three BS-170s to be able to

attach a thin heat sink to each transistor. (The PFR-3 has it’s three BS-170s in a single row but not side bye side so three heat sinks will be necessary instead of just one)

I had only got 5 xtals with my kit, and I also matched them but I confirm
that they were very close to each other, so matching is probably unnecessary
with most units of this kit. My crystals were as follows:

* 4.914680
* 4.914650
* 4.914645
* 4.914625
* 4.914630

The capacitor values were more spaced, so I matched those too.

(...)

Thats generally true, but if a board has only two sides one may also
do it differently, like this:

http://www.strozzi.it/users/carlo/hamradio/magicbox/epsn4714.html

The pic is of the 4SQRP Magic Box, which also had that problem (at
least with the sockets supplied with my kit). If you zoom into the
picture you'll see the keyhole-shaped holes for the socket pins. I did
that surgery with a very fine saw blade and a bit of patience, without
removing a significant amount of the hole inner plating. This certainly
requires a bit more care than simply cutting the socket pins but
it allows for more mismatch between the holes and the sockets.

Here is what I did, still using one single heathsink (I also took the
idea from the Tuthill 80 :-) :

http://www.strozzi.it/users/carlo/hamradio/pfr-3/epsn5144.html

(sorry for the pic out of focus).

Of course using three separate ones is also OK, just takes more work.
Also, in case the three transistors heath differently from one another,
thermally joining them together may help with keeping things cooler
because of the increased total mass.

ciao,
Carlo

Lynn,

I received my PFR-3A kit about a year ago, looked over your Youtube presentations, sorted the parts, fired up my very old Weller soldering iron from my Heathkit days and built the radio. I adjusted the frequency with a frequency counter borrowed from Notre Dame here in town. My PFR-3A worked the first time and I have been putting miles on it. There is so much variation in component values in general that all of this checking of capacitors, resistors, crystals and such seems to be a bit excessive!. This was a well put together kit with a great design producing what has become my favorite radio. Many thanks to Steve and Doug. By the way, the Hendricks QRP Kits "Tenna Dipper" is great, too,

Keith

2776. Build Progress

Yahoo group: pfr3_group
Date: 2011-06-29 03:51:54 UTC
From: lee
Topic: 2609 Message: 2776

I mounted the crystals this evening and tested out the receiver this evening as everything else in Stage 2 was finished. I hooked a alligator clip lead from the center pin of my antenna coax and the other end to the R1 antenna connection as outlined in the Group 2 smoke test.. I can hear stations but the sensitivity is down from my operational radio. (A 20 db over S9 signal can be copied on the PFR-3). I then hooked another alligator clip lead from the coax ground to the radio ground and this did not improve signal to noise. Tuning my antenna tuner does not seem to improve signal to noise. Tuning the receiver's C1/C2 cap does peak the signal near the CCW position as expected. The received frequency seems pretty accurate compared to my desk top radio. There is plenty of audio gain. LOTS of it! I'm not sure my findings are normal for this stage of the build. The only thing I think could be wrong is a crossover of one turn on the T1 5 turn link. I had a really difficult time trying to keep this from happening when inserting T1 into the board. I am almost positive I have the 5 turn and 40 turn secondary in the proper holes. (I don't think the preselector tuning would peak with the transformer windings in the wrong holes. I was pretty careful when installing the transformer).

The side tone produced when using my paddles seem to work just fine.

That's it for this evening! I'm going to bed. I'll deal with all this tomorrow.

It sounds like you are on the road, Lee, maybe with a winding miscounted.. but well on the way. At this point, might be that you could forge ahead, finish the build, then take a close look at the sensitivity.Congratulations for getting this far, so quickly,Have fun, and a great day,

Subject: [pfr3_group] Build Progress

I mounted the crystals this evening and tested out the receiver this evening as everything else in Stage 2 was finished. I hooked a alligator clip lead from the center pin of my antenna coax and the other end to the R1 antenna connection as outlined in the Group 2 smoke test.. I can hear stations but the sensitivity is down from my operational radio. (A 20 db over S9 signal can be copied on the PFR-3). I then hooked another alligator clip lead from the coax ground to the radio ground and this did not improve signal to noise. Tuning my antenna tuner does not seem to improve signal to noise. Tuning the receiver's C1/C2 cap does peak the signal near the CCW position as expected. The received frequency seems pretty accurate compared to my desk top radio. There is plenty of audio gain. LOTS of it! I'm not sure my findings are normal for this stage of the build. The only thing I think could be wrong is a crossover of one turn on the T1 5 turn link. I had a really difficult time trying to keep this from happening when inserting T1 into the board. I am almost positive I have the 5 turn and 40 turn secondary in the proper holes. (I don't think the preselector tuning would peak with the transformer windings in the wrong holes. I was pretty careful when installing the transformer).

The side tone produced when using my paddles seem to work just fine.

That's it for this evening! I'm going to bed. I'll deal with all this tomorrow.

Just thought of something. By injecting my antenna (on the air signals) at the R1 and T1 junction, as described in the manual, for testing the receiver, you are not running the signal through Q1, the preamp transistor. Maybe this is the reason signals are down. I think I need to inject my signal at the drain of Q1 and see what kind of sensitivity I have then instead of using the R1/T1 junction mentioned in the manual. Maybe the R1/T1 injection test is not intended to determine receiver sensitivity, but rather to test if most of your receiver is working without the Q1 preamp in line. Maybe I have no problem after all. I surely can understand sensitivity will be down if the preamp transistor circuit is not in line and not being tested. I'll know more tomorrow when I hook the antenna to the drain of Q1. (I would guess my 40 turn winding on T1 is good as C1/C2 peaks the noise in the position mentioned in the manual almost fully CCW).

For kicks I did hook the antenna up to the 40 turn side of T1. The CW signals were no stronger but, as expected, the noise shot way up in loudness as there was more bandwidth of noise feeding the rest of the radio with no front end filtering, and also not having even a low pass filter in line at this point. I think maybe this was a good sign signals were easily getting through U1 and the crystal filter.

This time I am going to bed!

>Just thought of something. By injecting my antenna (on the air signals) at the R1 and T1 junction, as described in the manual, for testing the receiver, you are not running the signal through Q1, the preamp transistor. Maybe this is the reason signals are down.

Q1 is not a pre-amp, it is the QSK switch and is a simple on/off switch which supplies no gain. The fact you can peak the Rx input means you have the coils wound and installed correctly.

The "clip lead" test is simply to show that there are no major problems with the receiver. Full sensitivity will only become apparent once the rest of the build is completed and a proper antenna connected.

OK, thanks, Steve. Yes, I later realized Q1 is a QSK transistor as the signal went from drain to source and not through the gate. I'll keep building. Thanks again.

Topic: 2784 Message: 2784

Hello!!

Well, I finished my PFR-3 a few days ago, and it is very nice! I have yet to calibrate the RX, but I think everything is fine.

Nonetheless, something is bothering me: My power output "drifts" on the 40 meters. What do I mean? It does not pull all the current needed at once.

I'm doing it with a straight key and a Dummy load. I start TX, and it gets around 2.5W. And gets "growing" until it reaches 5W after something like 4 or 5 seconds. Any idea on why this happens, and what could be causing this?

I rewound the 40M toroids, but no improvements concerning this.

On 30 and 20 Meters, this doesn't happen.

Thank you!

Regards

Felipe - PU2OVA

Hello
The list pfr3 seems calm now
Y t there any ham radio waiting for their kit?
I'm waiting, I bought since 3 Jun and Doug had planned on 25 shipping if possible,
then maybe there are missing components,
I think it would also take a little rest.
And you have news on this side?
I wrote directly but I have no answers for now.
Maybe I'll have a new version ... H.I.
(I'm kidding a little bit of course)
73s
Jean-paul F6DDV

I've asked this question, but anyone know if it is possible to try to place the FM modulation (BPSK)?
Perhaps with a varactor circuit or other?
To receive it should be possible I think looking for the right place,
it might be an idea of evolution for this small QRP yellow.
I ask myself the same question for the HB-1A, it would be very interesting

Howdy,

Not much to wrong there. If you have +5V at U2, with a local receiver, check for clock 'noises' at 10.0 MHz. If no 10 MHz then, as the troubleshooting procedure says, check for bent-over U2 I.C. pins. You'll have to remove U2 to check that. If all that looks good then it's probably U2. There have been some problems with the uPs in the PFR3A lately. Maybe that malady has struck the Deluxe Tenna Dipper. Hope not but it's sure looking that way from your description.

Best of luck with the troubleshooting.

If you had to bend the pins of the processor chip (the tiny2313) to make it fit into the socket, then it wasn't programmed. Doug apparently had a tube of unprogrammed chips accidently mixed in with the programmed ones.

You can either ask Doug to send you a new processor, or send the one you have to me to be programmed.

It is not possible to modulate a CW rig like the PFR-3A or HB-1A directly via a PC sound card. This can only be done with a SSB rig.

However, it is possable to produce PSK-31 with a CW type transmitter if sufficent additional circuitry is added. An example of such a transmitter is on my web page here http://kd1jv.qrpradio.com/PSKV3/PSKV3.htm

The disadvantage of the above transmitter is that it lacks ease of "point and click" frequency adjustment everyone has become accustomed to when using PC based digital mode software.

In theory, the use of the DDS ocillator in the PFR-3A, HB-1A and KX1 for that matter could allow the generation of pretty much any digital mode you can think of. However, there are two significant problems in doing so. (BTW, if you compare the circuit of the HB-1A to my ATS-3 rig and the Elecraft KX1, there are remarkable simularities..)

The first problem is of course, all the new firmware which needs to be written to suport those modes. It is unlikely the processors currently used it those rigs have sufficent program memory to allow the addition of the extra programming, so chips with bigger memory sizes would need to be subsituted, though that isn't really a big deal.

The second problem is that common PC based digital mode software will not work directy with a DDS based digital mode rig, as direct control of the DDS chip is needed.

The above problems were addressed and solved by Volteck, OK1IAK, for my ATS-3B and ATS-4 series rigs. Volteck wrote firmware for the processor used in the ATS rig to produce several digital modes with the DDS oscillator and a means of controlling it via an audio frequency based PC soundcard modem. The program is called "Pocketdigi".

So, now you might ask, why can't the firmware written for the ATS rigs be ported to the PEF-3A to allow for digital modes? The answer is that the type of processor used in the ATS rig has features which makes the AF modem reasonably easy to implement and the AVR processor used in the PFR rig does not.

re hello Steve
So I can tell you that I do not regret having asked a question a bit ridiculous,
because you say so clearly that it is a pleasure to read.
The link you gave an error, but I just got back to your website and I think I'll have plenty to read quietly,
it's really impressive, and do not say this just to please you ... there is a mountain of interesting things.
The idea of adding a circuit for PSK within a small QRP takes a lot for me to study before making but an interesting idea,
I just may be to quickly understand that we must build QRP TX only one for that, simple as editing a pfr3 or HB1-A ...
H.I.
In fact I had completely forgotten the famous "pocketdigi" and yet some French friends have told me that it works very well.
I do not know if my HP Ipacq RZ1710 can work with, I think so, but it's still hard interface which creates problems in general.
Thank you for your explanations

Opps, sorry, should have been version 2. The corrected link is below. Version 3 hasn't been added yet. V3 eliminates the audio input circuits and subsitutes a uP (a MEGA48) to directly modultate the PA using a D/A converter and control the phase shift XOR gate. This produces true PSK-31 modulation directly using either a keyboard or Morse inputted via a paddle. Kind of neat actually...

Hello Steven
Oh, but it is a gem ... and there are positive to the citrcuit printed.
Ah, I recognize the PA with 3 BS170 ... (5 W, no doubt)
I still did not understand everything on the operation, but must also make the CW (which can be less ... HI)
possible or not to connect a modern soft? , Sorry I look quickly at the moment, it's clean and well ...

All right, I put everything in Word, captured copy / paste in English and translated into French, and the PDF with the printed circuit ...
So it will be a project for the future ...

what I like is that the components are standard I think.But we must give it to Doug to sell in kit! HI
to look closely ... I do not know if a lot of ham radio built?
In addition it is not very big I think.
Well, I also have the PSK Naked surely you know that's why I wanted to make a change. in QRP,
but hey, too simple in my mind, thankfully you have tidied ... HI
I will study more carefully because this assembly looks very interesting, and simple compared to what is seen
as a kit around with a bunch of surface components.

Opps, sorry, should have been version 2. The corrected link is below. Version 3 hasn't been added yet. V3 eliminates the audio input circuits and subsitutes a uP (a MEGA48) to directly modultate the PA using a D/A converter and control the phase shift XOR gate. This produces true PSK-31 modulation directly using either a keyboard or Morse inputted via a paddle. Kind of neat actually...

>The link you gave an error, but I just got back to your website and I think I'll have plenty to read quietly,

Hello friends list
The kit pfr3 is on the table! Finally ...
OK in my letter box today shipped on June 25? ...
No, just kidding, you know me a little now, there was the backlog and problems for some items I think ...
Now it only remains to prepare the components in small boxes and then build slowly ...

Thanks Doug

Jean Paul,

Just a note regarding the torroids. I did NOT hot glue (or any other special attachment) the torroids to the board. All I did was pull the wires from the torroids as snug as possible. I have been using my PFR-3A outside in the field as well as in the home shack for over a year. It is rock stable and except for running out of battery power has never let me down. I take responsibility for the batteries!

Hello Dale
Yes, I agree with what you write
after reading many testimonies of ham radio on this kit, it is logical to conclude that if the manufacturer Ham R.
is careful and soda properly, it works the first time.
Looking closely with the big magnifying glass, the printed circuit board is of the highest professional quality.
Most likely to succeed with a kit like this one

Well OK Keith
I think hot glue is not always the best
I much prefer a piece of non-magnetic sheet foam adhesive double-sided,
I am wary of the constraints and mechanical thermal units with hot glue or resins on parts of radio electronics.
I found problems in some fixtures.
But if we fast and we do not put too many of these products it can go well.

2805. Re: [pfr3_group] Build Progress (L7)

Yahoo group: pfr3_group
Date: 2011-07-08 01:38:37 UTC
From: lee
Topic: 2609 Message: 2805

I had a little time last night and today and worked on my PFR-3 build.
Last night I epoxied a 1/4 inch x 1/16th inch piece of brass sock to each of the three BS 170 output transistors as heat sinks. (I bought the brass stock at my local hobby store.) This went very nicely. I got the idea from the Scorpians Tuthill 80 kit which uses two BS 170 transistors in their design,
Today I installed the transistors with their heat sinks on the pc board. The instructions then tell you to test the transmitter build at this point without installing L7. (This keeps power off of the output transistors during the test). I have not done the test yet, but I did wind the 8 turns of wire on the L7 core and put it aside until I do the test without it being installed.
That said, I am a little confused about L7. In every kit or project I have built, a turn on a core is considered accomplished every time you put a wire through the core's donut hole. If you do this for this project and wind 8 turns (8 passes through the donut core), you wind up with a wire end on the outside of the core and a wire end on the inside of the core with both ends on one of the flat sides of the donut. Most pc boards I have encountered account for this by staggering the two wire holes so one hole is close the the inner perimeter of the core and the other hole is near the outer perimeter of the core. Not so with this board. To make things less handy or understandable, the manual's pictorial shows the two wires passing over the top flat side of the core and then they go down into the two pc board holes. This cannot happen as outlined above. If the pc board holes are not staggered, as they are not on this board, then the manual pictorial should have one of the wires shown as a "dotted line" indicating the wire lies between the flat core inner perimeter and the pc board hole near the outer parameter and the other wire drawn as shown on the present pictorial.
I am pretty sure I know how to mount this L7 core (choke), but frankly, the instruction's pictorial is not drawn correctly and one L7 board hole could be in a better place or position. (staggered). I think the instructions would be very confusing to a newer type builder. (Sorry for being a PITA).

2807. Low Power

Yahoo group: pfr3_group
Date: 2011-07-08 03:16:47 UTC
From: Felipe Barco
Topic: 821 Message: 2807

Hello, all.

Last week, I wrote about my PFR-3's Power Out drifting on 40M.

Speaking to Mr. Weber, he confirmed what I thought. Could be a bad capacitor on the LPF.

I changed all caps. One at a time, from C60 to C63.

When I changed C61, Power Out improved in something like 0.5W. But it was still drifting.

When I changed C63, the drift not only continued, but now I have 1.5W on all bands.

BS170 are Stable, and 12V (actually, 11.8V) are being drawn on TX.

The interesting thing is that testing with a Probe, the capacitors are showing a value similar to what I used to have on the Dummy Load for testing the Power Out.

First, I had a trouble that no one could solve. Now I just changed a cap and this happens.

If I can't solve this soon, I think I'm gonna quit.

I'm no electronics engineer, and here in Brazil this kit costs a lot. Now I'm having troubles that nobody knows what to do.

If you can, please, give me a light.

Thank you

Felipe - PU2OVA

2808. RF Output Filter Capacitors

Yahoo group: pfr3_group

From: lee
Topic: 2609 Message: 2808

Talking about output filter caps, maybe my question might be best served by hearing from Steve. Others might comment on this.
I have heard from time to time low pass filter caps that are silver micas give better performance then mono caps. Ever since reading this, I have always been partial to silver micas here. I know they cost more. I have never heard negatives about using silver micas in a low pass filter. From time to time you read where someone has replaced the mono caps in a low pass filter circuit with silver micas and improved RF output. I've been using silver micas a lot here, but maybe just out of fear.
That said, I'm wondering if Steve ever did a study on this for PFR-3 rigs. I'm thinking seriously of putting them in my build. I have not decided to do this for sure but am seriously thinking about doing it. Anyone have any comments or experience on this subject?

Hello everyone
I'm not sure, but I think it's Steve who wrote it, it seems that these small MOS do not support large RF feedback,
and it's not the temperature that will destroy them, but a excess of HF.
I was surprised to see the DC30B over 1W RF (in continuous carrier) and the transistor is not even at 30 ° C temperature ...
I was stunned a year ago.
3866 is already a hot with that power.
So I expect to have further confirmation, but maybe put a cooler on the transistor that does not have the metal body,
is not very useful, maybe add capacitors are metal bodies and radiate is not a quick fix?
May be that if a manufacturer
had a metal equivalent MOS transistor designed for a cooler that would be different, it's just a question of me,
I await the reaction of people more competitive than me.
Maybe I should put myself coolers to reassure me ... H.I.

Hello Ray an alls
I do not like either the internal battery cell, because it is difficult to find good quality, there is much to write about it, the batteries 1.5 v will be more effective, but expensive and c ' is wasteful.
The 8 cell battery 1.2 v long time will not 12v,
pfr3 but works well below I think.
The NICD has a chemical memory but were better than the current NIMH who lose their charge without being used, and there are plenty of poor quality, written in 2500 and 2800 mA / h and do not keep their promises (unless you buy the good batteries or other aviation model, but not the same size)
I do not like boxes with springs and chrome steel contacts because the contact resistance x 2 times the number of batteries, trying to make a real measure on the power cells work and you will see that very soon there are volt go into heat or salt production, (or you weld of good models)
(I have a lot of these couplers cells give to friends, or just good for quick testing) in the analysis of antennas MFJ I have removed and welded 3 cell LiIon 3.6-v PC as well.
Personally, for PFR3 would put a block of 3 cell LiPo (Lithium Polymer) 11.1 volts 20C outside 1900mA / h or better 5000mA / h battery charger adapted, you will be satisfied, it gives a good 12v long without any problems.
(Note that 800 mA fuse required> 1 A max! And if you can diode in reverse parallel to protect against polarity error ...)
Voila, I'm a little too demanding about the quality can be, because if the contacts are in good condition and checked and cleaned, it can work quite well ... H.I. (it's just my opinion)

I'm working on switching to the Sanyo eneloop cells for their very low self-discharge properties. I've been frustrated with a series of "no name" high capacity NiMH batteries purchased over the last several years that self discharge to non-useful in a month or two! I guess you get what you pay for....

The standard AA Sanyo eneloop battery is rated at "2000 mAh typical capacity and 1900 mAh minimum capacity and up to 1500 charge/discharge cycles". These are NiMH chemistry, but are rated to retain 75% of their charge after three years.

Sanyo introduced the XX version of the eneloop battery last Fall, rated at 2500/2400 mAh, but with a 500 cycle rating and 75% capacity after 1 year, so there is a slightly higher capacity alternative with relatively low self-discharge properties. I have not tried these.

http://www.eneloop.info/products/batteries.html

Ultimately, I'm looking at devices now powered with lithium chemistry batteries.

Steve,
I too have had problems with the the high capacity no name NIMH batteries holding a charge in other devices. Very disappointing. I've also been thinking about using the Sanyo eneloop 2500 mAh batteries now available but maybe trying to shoe horn in 10 of the cells instead of 8 into the PFR-3. My PFR-3 is not complete, so I am not sure 10 cells will fit, but hope they would fit. My thought was to use the two supplied 4 cell holders in addition to another 2 cell holder if all will fit "under the hood". The only problem with this approach is it would be better to remove used up cells and recharge them in parallel instead of series. I don't like the thought of removing cells each time for charging from the cheap plastic battery holders or having to take the cover off the rig each time they need charging. I think that approach would cause the cell holders to fail fairly quickly. Having a little shorter life by charging in series and not removing the cells appeals to me a lot. If I don't do either, I'll probably live with my "outboard" 7 amp gel cell.
The Sanyo 2500 eneloop batteries are not cheap, but probably well worth their cost of around $6.50 each. With 500 recharges, that price does not seem exorbitant.
The La Crosse Technology battery chargers also look great but can only be used if the cells are plugged into the charger in parallel configuration. I bet the Sanyo batteries would hold up well if used with this really smart charger. If nothing else, it would tell you which cell is failing and you could remove it from service before it helped bring down other cells. Again, the only bad thing here is the cells need to be removed from the rig for charging. I don't believe the cell holders would hold up well to constant cell removal.
Lee, w0vt

Steve,

I have heard the rule of thumb for power loss in regular mAh batteries is 10% loss per week. Not very acceptable for a flashlight in your glove box. I guess OK if you plan to use up all the energy stored quickly. I no longer consider NICD as I don’t want to deal with cell memory. I think the Sanyo eneloop are the best choice today although the old clunky 12 volt gel cell for $20 new are really hard to beat if you don’t have to have compactness. 2500 mAh eneloop at $6.50 each comes to around 13 cents per charge per cell. That times 8 = $1.04 per charge or times 10 = $1.30 per charge. This sure beats the cost of alkaline unless you consider you only need 8 alkaline cells for 12 volts vs 10 cells with the others. However, alkalizes “sag” voltage as they discharge whereas the other have a pretty good knee before they sag. A lithium-ion 11.2 volt @ 4400mAh battery will cost around $70.00. They supposedly lose around 5% to 10% of charge per month and also like other types, degrade over time. I think you can charge them from a depleted state faster and safely more so then other types. Right now, their price seems too steep for me compared to the Sanyo eneloop batteries. I guess it all comes down to personal preference as there is no free lunch. Pluses and minuses for all. I guess what is important to you is the most important factor when selecting an appropriate battery type. I’m going to try the eneloop type next.

Lee, w0vt

I'm working on switching to the Sanyo eneloop cells for their very low self-discharge properties. I've been frustrated with a series of "no name" high capacity NiMH batteries purchased over the last several years that self discharge to non-useful in a month or two! I guess you get what you pay for....

The standard AA Sanyo eneloop battery is rated at "2000 mAh typical capacity and 1900 mAh minimum capacity and up to 1500 charge/discharge cycles". These are NiMH chemistry, but are rated to retain 75% of their charge after three years.

Sanyo introduced the XX version of the eneloop battery last Fall, rated at 2500/2400 mAh, but with a 500 cycle rating and 75% capacity after 1 year, so there is a slightly higher capacity alternative with relatively low self-discharge properties. I have not tried these.

http://www.eneloop.info/products/batteries.html

Ultimately, I'm looking at devices now powered with lithium chemistry batteries.

Steve and Lee,

I had intermitent connection problems with the end to end battery holders that came with my PFR-3A. I switched to two-four cell units that have the batteries side by side and have had no further problems. It would be tight but you might be able to add an additional two cell unit.

Subject: Re: [pfr3_group] Re: Internal Battery type?

Steve,

I too have had problems with the the high capacity no name NIMH batteries holding a charge in other devices. Very disappointing. I've also been thinking about using the Sanyo eneloop 2500 mAh batteries now available but maybe trying to shoe horn in 10 of the cells instead of 8 into the PFR-3. My PFR-3 is not complete, so I am not sure 10 cells will fit, but hope they would fit. My thought was to use the two supplied 4 cell holders in addition to another 2 cell holder if all will fit "under the hood". The only problem with this approach is it would be better to remove used up cells and recharge them in parallel instead of series. I don't like the thought of removing cells each time for charging from the cheap plastic battery holders or having to take the cover off the rig each time they need charging. I think that approach would cause the cell holders to fail fairly quickly. Having a little shorter life by charging in series and not removing the cells appeals to me a lot. If I don't do either, I'll probably live with my "outboard" 7 amp gel cell.

The Sanyo 2500 eneloop batteries are not cheap, but probably well worth their cost of around $6.50 each. With 500 recharges, that price does not seem exorbitant.

The La Crosse Technology battery chargers also look great but can only be used if the cells are plugged into the charger in parallel configuration. I bet the Sanyo batteries would hold up well if used with this really smart charger. If nothing else, it would tell you which cell is failing and you could remove it from service before it helped bring down other cells. Again, the only bad thing here is the cells need to be removed from the rig for charging. I don't believe the cell holders would hold up well to constant cell removal.

Hello Steve
It's good that the NIMH study Sayo better, because I'm a little angry with many brands of this type do not keep their promises written on the cell NIMH batteries.
the limit, the NICD, despite their lack of memory chemical (it was simply meet full discharge cycles), but it is difficult to explain this to many users who are unfamiliar with the subject of batteries.
It is also difficult to understand the balance of each cell must be identical.
If you want cell batteries that retain their best and give a good volt power must be of interest to cell LiIon or LiPo (3.6 and 3.7 volts) must also balance them, it's the same principle but c is more delicate and more dangerous in case of accident or mechanical courcircuit or surcharche of elements, it can just explode and spread the fire! we must not forget the fuse ... because the power in a few seconds can be huge!
You need a charger called balanced Charger
Thus, for 12 v, 3 cell are correct and there are 2 large output cables and also for balancing four small cables connected to each element.
No room for "anything", but a lot of satisfaction in the end, it is very effective if one is careful and cautious.
73s to all, hoping you have filled

Hello again and good morning
I think it may be advisable to ask for people who practice model aircraft.
I would not give an opinion too far because there are advantages and pitfalls of in all kinds of rechargeable cells, require some caution and great care, it can be annoying to some people who prefer simple cells in use.
However, it is interesting that it's a bit similar, and those practicing model aircraft have more knowledge in this area, because for them the knowledge of the quality of the battery determines the life of model aircraft.
All rechargeable cells have a life, but by the time they are used, it is more interesting to have things in the hands of powerful and reliable, although they can sometimes take less time.
The choice is yours, I have left some batteries because they may have lasted long, but during the time that I have used and did not give me satisfaction, sometimes I wanted to use some of the cell, they were discharged or died.
So I spent all too often in poor quality, so now I choose the better the quality.
So I consider that the low price is not the only critaire important, what matters is performance, for a show that lasts a long time with constant power.
Another critaire is a lot of attention and regular monitoring of battery packs, you can use less expensive batteries, but there is waste, we must check one by one and throw, and finally it is very annoying, and sometimes it costs more.

Steve,

I have heard the rule of thumb for power loss in regular mAh batteries is 10% loss per week. Not very acceptable for a flashlight in your glove box. I guess OK if you plan to use up all the energy stored quickly. I no longer consider NICD as I don’t want to deal with cell memory. I think the Sanyo eneloop are the best choice today although the old clunky 12 volt gel cell for $20 new are really hard to beat if you don’t have to have compactness. 2500 mAh eneloop at $6.50 each comes to around 13 cents per charge per cell. Hello all !

For my portable activities, I decide to use an external rechargeable battery, as you can see in the picture below. The "black box" is a BBS Universal Charger with 16000 mAh capacity and provides 5, 9, 12, 16 (selectable) and 19 V (fixed on a second outlet). I can use it not only for my PFR but also for phone or laptop supply/recharging. It can be recharged at 220V (or 110 V for US), 12 V from car and there are also available models with included solar panel.

Being a Li-Ion Polymer battery, it is very light (abt. 400 gr.). I think my key weighs twice ! HI!

Best 73 !

Ken,

Thank you for your reply. I am a little wary of using internal rechargeable batteries but was interested in what others were doing. I will be using a series diode to drop the voltage when I use an external gel cell..

Thanks once again.

I would also suggest that anyone considering the model aircraft/ship/car/robot battery packs of whatever chemistry take a look at the chargers made for these packs. Most, if not all, chargers that will charge Lipo packs have balancing connections.

Hello Jean-Paul !

Please see the link from the Romanian e-Shop, with the products lists: https://www.fungadgets.ro/incarcator-extern.html. The site is in romanian language but you can use the models name (in english) and the codes for internet searching.

My device is a BBS Universal Charger, with code BBS-SB02X (16000mAh, w/o solar panel).

Battery type?

Hello all !

For my portable activities, I decide to use an
external rechargeable battery, as you can see in the picture below. The "black box" is a BBS Universal Charger with 16000 mAh capacity and provides 5, 9, 12, 16 (selectable) and 19 V (fixed on a second outlet). I can use it not only for my PFR but also for phone or laptop supply/recharging. It can be recharged at 220V (or 110 V for US), 12 V from car and there are also available models with included solar panel.

Being a Li-Ion Polymer battery, it is very light
(abt. 400 gr.). I think my

key weighs twice !

type?

Ken,

Thank you for your reply. I am a little wary
of using internal rechargeable batteries but was interested in what others
were doing. I will be using a series diode to drop the voltage when I use an
external gel cell..

Thanks once again.

Hi !

The device is not a romanian brand and, like a lot of actual products and brands, it is made in China. I found the product on the following site:

http://www.alibaba.com/product-gs/346508998/BBS_solar_cellphone_charger_bag.html

Scroll down and you will see this battery and other similar products. At the next link, you will see the similar model but with the included solar panel:

http://www.alibaba.com/product-gs/436905379/Solar_Laptop_Charger_with_2A_Maximum.html

Regarding the output voltages, there are different types. My battery has one output for 5, 9, 12 and 16V, selectable, and a second output for 19V. Other models has one output for 5 V and the second for selectable 9, 12, 16, 19 V. For my application, is useful to have a 19 V for laptop separated from 12 V output nedeed for PFR. Anyway, the battery has a very useful protection system: you can not switch the output voltages with the plug connected in the outlet battery. You must fix the desired voltage first and after that you can connect the plug. So, it is not possible to switch to 16V while you work at your PFR (or other device).

Regarding the solar panel, the romanian users of this device told me that for an empty battery you need 12-14 hours of a sunny day for complete recharge of the battery. Personally, I prefer to spend money to a high capacity instead the solar feature. But, anyway, the non-solar model that I own have an USB port for connection with an external solar panel. So, if I change my mind, I will buy only a small solar panel.

In the last week-end I was in YOFF-021 and YOFF-164 areas. In 4 days, I worked about 14 hours and was not necessary to charge the battery.

Hello John
Do not be disappointed, you will not be left alone with your problem, you know that Doug replaces everything that is wrong, and then there's the mailing list, and probably have friends who are willing to look at your building and at the end I'm on ... I read the list, you can mail your artwork there will be a ham radio that will help you for sure.
I can tell you that USPS walks like a turtle right now, I expect a small generator Elecraft and is stuck in CA for a while ...
Think I'm in France and I totally do not read English well, I just started editing, and I have confidence in one way or another it will eventually work.
My Kit DC30B had problems and they are resolved, sometimes you have to stop a few days, think calmly and as it returns to the (site) you becomes clear.

I came to a Group Led display module, and I have a doubt on the measure mm above the circuit board.
I saw that the capacitors 101 and 47 discs are a bit too big and the legs difficult to change, I was almost decided to make other models that I have here, but never mind, I would do with the batch of parts provided, because this is what was planned for that!
Love to all and good day
We have rain for 2 weeks and here comes the sun!

Hello everyone
To position the LED display module I think the best way is not to measure.
It's much easier to stick the red filter inside the box, place the LED display and screw the PCB in its place,
then we check that the power LED works well with a small stick wood or something, it can even stall a bit
to apply it well and push a little on the feet or above.
and welded, and we are sure that even if everything is not perfectly straight in the box or the map display
will be led gently into place at the end of the assembly.
I find this way easier and that's how I did.

Hello All:

That is the same way I did mine. I placed the LED display in the holes, then set the board in the top section and held it in with 2 screws. I tack soldered two opposing pins and then took it all apart to finish soldering the display.

It fits like a glove. Great rig. Use it all the time on the patio.

Hello Carey
Ah, I'm glad I'm not the only one who had this idea ...
And I must add that this way of lighting may be more effective.
I can also say that very little excess length of legs, they feel just by passing your finger on it, not even need to cut.
But be careful what we write, there may be several brands of LED displays

OK Keith

I often work this way in many montages, even mechanical.
The assembly compared without using a measurement tool as it can be done because the materials are never perfectly regular.
on the LED display, like this one is absolutely certain that it will be exactly the right place.
I just finished the group # 1 and test their smoke and I started the group two tonight

Dayton Oh! ...
Dayton is located or in what state USA?
I do not think that I would one day here, but just to know? ...

Hi John,

One thing I love about building qrp kits is that it teaches me to be patient. And I mean that in the nicest way possible. I had a problem with U7, which wasn't programmed. Once this group helped me identify that as the problem, an email to Doug was all it took. He popped two replacements in the mail that same day. I live Down Under, so the post took over two weeks but it did eventually arrive and I am now back on track with group 1 testing working out as it should. You can follow my build progress on my blog, which you can find here: http://vk4jaz.wordpress.com/
Oh, and my next purchase from Doug will be the Deluxe Tenna Dipper, as it looks like an invaluable piece of gear to have around the shack.

Regards
Grant VK4JAZ

Grant, I'm glad you got your chip in 2 only weeks in VK-land. To some the state of Arkansas (where I am temporarily deployed) might be considered out of the country but it really isn't and it is served by the US Postal Service. Maybe it was sent and returned for some reason. Maybe it is out of stock. How long does it take to send an e-mail with an explanation? Why would I be told that it was shipped? Meanwhile my bank account is down $80 and I have some worthless parts laying on my desk.

Hello again Grant
Oh, not programmed U7 ... no luck, Hum ... good, it can happen of course, nobody and nothing is perfect ...
One thing is certain, and had understood from the beginning, for various reasons I took the last few years we know that the company Hendricks is not a plant that produces huge lot with many employees, from of this, I chose this small business for good construction craft but for the opportunity to get help and also ensured the replacement of all defective parts that need it more?
and then I like what is a little different from conventional assemblies, it is even possible to talk to the "daddy" and change things if you want, and more ... it's interesting to ham radio I think ...
PFR3 this to the advantage of being powerful enough to have a tuning system integrated antenna, no need for a "box" and more, and a balanced output and the receipt and correct as far as I read, there is room to put an amplifier and a speaker, the price is also very attractive, so if it's a bit long to wait for the answers and the kit, well we know why we accept this principle or the second solution: we leave more money and we will buy elsewhere ... H.I.
All 73S
jp F6DDV

Another thing:
I wonder if I will not try to BS170 two parallel instead of one on my DC30B, one must gain some W and suffer less, it takes no more space ...
I think I'll order a kit DCxxxB and try to make a 3-band with small plug-in modules, or switch.
the concept of mounting is simple and good and 1 W output is easily good for a TRX already so small.
we just think of something small to 3 quarts of QRP frequencies with some VXO, easy, I think about this for a while ...
may be a printed circuit board and more possible to have?
I no longer hope for the boxes, they are no longer available, we must find something else not too big to fit in your pocket ...

Hello everyone
I am a bit embarrassed by a series of capacitors are very difficult to set up, remove the insulation and twist the legs to bring them closer, and even then they go down hard, it's impossible to beat without destroying them.
(C7, 8, 9, 10, 11, 13, 14 and C43 and 44)
These capacitors of 100 pF disc (101) are much too high, they do not lack much so that they touch the bottom of the case.
I hesitate because I have here 100 pF ceramic blue much smaller, there are at 9 and very difficult to install, I managed to put in place by pushing hard,
but they are huge and the picture it is clear yellow capacitors are much smaller than those provided. that models are a bit old ...
I did my best and yet, I did not ask them their opinion, they went to their place by pushing hard! H. I. ....
I did not welded, I hesitate a little, I do not find this beautiful ... maybe tomorrow it will be removed, because the XTAL be a fair bit to put in place as well.
It's a shame because there are many different brands and there are smaller models, some models are difficult to recognize as well.

put some "z" bends in the leads with your needle nose pliers, they will be
fine... don't remove the insulation or twist the legs though, you might end
up killing them.

Hi Mike
Yes, it is also a solution, but it leads to an aditional rise up, and I see that compared to the LED display which is the limit there are only very few,
and I do not like capacitors are too close to the mass of the box as it is a parasitic capacitance and more.
I'll leave them on, I broke very closely with the tongs and taking care of the insulation ceramic pellets, then very carefully we manage to bring the legs
to be almost in proportion to the space the two holes.
I'm used to this, the capacitor 9 are in good health! H. I. But I still say they are too large.
But this way, they are not too close to the case, I'll leave them on, I do not replace them because I am also to models with a different reactor,
the ceramic discs are in very pure HF.
But you are right, this is very difficult, it takes time and a little patience with each capacitor.
Well, we've had worse than this, it does not matter, it is more useful information on this list very useful.
I make a macro picture of each stage group 1, 2 and subsequently
It's easy and can be useful to other ham radio, and then also remember ...

2859. Magnetic measurements of the wires in #?

Yahoo group: pfr3_group
Date: 2011-07-24 15:35:13 UTC
From: f6ddv
Topic: 2859 Message: 2859

Hello
I see references Wire
30 # 28 # 24 enameled wire called the magnetic wire
I am not accustomed to writing this way so I took the device to measure the diameter of the three wires provided.

I find 0.65 mm 0.33 mm 0.26 mm metric

I guess:
30 = 0.65 mm
28 = 0.33 mm
24 = 0.26 mm
normally it can not be anything or it's the wrong way ...

JP,

The reason the board has 4 holes is because after you wind the 5 turn link by looping the wire, YOU THEN CUT THE LOOP WIRE. You now have 4 wire ends. Yes, both wires cut from the loop are grounded through each of the 2 holes.

Hi Lee
Thank you for answering me, and also to other ham radio
Indeed, now that I begin to understand it all makes sense, but may be afraid to make mistakes in meaning and be forced to use the desoldering braid to a place like that, I do not too much, sometimes it's the damage.
Now everything is clear and simple, but initially it leaves a little waiting, if I had not looked at the schematic I think I always wondered what it's like this drawing ... H. I.
Especially when several things and we are only 5 minutes trying to figure out, you say "this is not possible that I am my intelligent monkey ... What is that thing?" ...
Well, I'll continue to work a little on the small yellow box a little every day rather than talking stupidly, H. I.
We must spend 5 times the core wire in circles? because the drawing I see only 4 times ...
A wire passing through the torus = normally a complete turn and here we speak of turns around ... it's different and it is important for all cores, it can be a source of errors and malfunction, I read it for other kits is a discussion known, two loops of finite torus = 2 turns + 1 / 2 turn in induction ...
73s
jp F6DDV

Hi Bob and other
There are a lot of progress on LiPo batteries (3.7 V) is 3.6 V LiIon and rather Reclaim laptop, less efficient?
Prices fall a lot, and some sellers of China (the willing sellers for the model) are very interesting LiPo packs.
The pfr3 progressing slowly, there are doubts sometimes, and I am a bit picky and very strict on the accuracy.
I decided to put the story in pictures, not because I'm better, but instead to show my problems and my issues were the responses of friends from the good mount, so that the ham radio that ask questions sometimes find the answers that I had trouble finding ...
And there are further questions, you can make mistakes, I do not like to redo desoldering.
It is important macro photos and clear explanations.
I discovered with great surprise that other ham radio had posted albums, I can be a bit silly, but I did not know ...
No one had said there were many such albums.
It is easier to get into a good drawing or a good picture than trying to explain in writing sometimes.
I think Hendricks society should place on the assembly instructions on the Web online hypertext to the right pictures probably better than ours.
We can make mistakes, but they are more qualified.

Subject: Re: [CW-QRP-Homebrewers] Re: Batteries, again

Hi Bob
Yes, this principle is correct on the principle of pure calculation, but it's not that simple.
But the difference is the internal resistance of the Cell Battery
That is why with some volts batteries fall more easily, because they produce it in the heat or gas not used in W output, and that the manufacturer does not say.
Lead acid batteries are the thickness of lead that reduces and also the quality of lead oxide, and I noticed that lie on the same power intantanée, on top and put a shunt that requires large amount of amps there can be big differences between two marks, or it is marked the same number in amperes per hour ...
This way you can test the effectiveness of any cell battery, and you'll be very happy or very disappointed ...
The ability to provide a large instantaneous power concervant the same potential difference is a good sign.
On a Cell Lipo battery, you ask about the V 15 A does hardly fall, while HF 5 W with 10% efficiency, resulting in 5.5 w 460mA then, it will not do a lot of drop-volt unless the internal resistance of the battery cell is added and there are W and more consumed by this.
This is unfortunately the case with many cell batteries with a construction technology a little worse.
The also saw the 2800 mA / h some cell batteries were a pure lie, so I searched and compared as the lead-acid batteries.
The disappointment was great on unknown brands built with materials of poor quality.
and you can be certain that the internal resistance of the Cell battery is very high, and as you multiply by a large number of batteries in series, it is a disaster, and I can also speak to the contact resistance, especially if the box assembly is made with lots of chrome springs and contacts ... that adds strength, if not welded.
Exactly, this is rarely the case on LiPo as a cell lipo alone is already 3.7 volts, it takes less to 12 volts.
But everyone is free to do or think as he wants, he must above all be tested extensively.

Subject: Re: [CW-QRP-Homebrewers] Re: Batteries, again

I look at it this way
5 Watts is 5 watts.
You use 5 watts then you draw enough amps to get those 5 watts no matter what battery you use
When those amps drop down the voltage drops with it

Hello Chris and the guys at bob + list
I think we talk about power QRP 5 W or 10 W maximum RF Radiated?
We must know what we are talking about and exactly what you want
LiPo batteries are small in size and very lightweight, QRP activity we are talking about, why weight is important, lead-acid batteries is to set aside for transportation for me.

A 3 cell Lipo battery cells in 30C provides 5 amps continuous
and weighs 300 grams and it is almost in hand.
It gives a sufficient pfr3 volts or HB-1A with no drop in volts.
15 amps but accepts without flinching a brushless motor that draws 15 amps hanging over 1 / 4 hours
a 5 W QRP you take the day without any problems on CW.
10-W SSB or PSK at least 5 hours.
I tried with lead-acid batteries 7 amps / h they do not even do that, maybe the manufacturers of lead acid batteries do not tell the truth about the capacity of their batteries, and I would forget the cell NIMH batteries is a catastrophe, for the same value ... and they lose their ability without using only two weeks to rest, as they are to use the 1 / 3 of the capacity was "surge"!
Never a cell LiPo battery will do that, it retains its volts for very long.
You know, the Aero model makers are not kidding about the effectiveness of cell batteries, we can have confience.
the former were better than NICD NIMH chemical but the memory required special attention in the interview.
Or you must go to the very high quality NIMH, and then my friends you can make money!
So I naturally came to that conclusion, and I tested.
There are far superior in power, but stay with the LiPo 5000 mA / h seems to me enough, you can have several, it's better to be able to recharge in sun or have 2 or 3 charged in advance for the laptop.

Good evening again
Thank you Steve and Bob, it's always nice to know when one has a doubt, I put the 102 in U1 if it is better ... H. I.
Just one question: If we want to advance in the assembly and let the smoke test number 2 from the side and back then, I think that's possible? course, even as I try the RX ... maybe at the beginning of a fast pitch with the VFO trimmer C16 is enough until something better.
I just got the small generator Elecraft but I did not well in hand, and my scope is passed QRT (smoke) not repairable.
I understand that such an oscilloscope soft free by the sound card would be OK? For the 10 MHz WWW possible, I will Qualibre a small portable frequency counter with the help of this particular radio signal and an oscillator and then it will be possible to settle 10.MHz correctly I think, I can not understand any English, but in return many times I begin to understand better after a night's rest ... H. I.
I noticed that T1 is better presented as the nucleus is at right angles to the drawing, and yet I do exactly the turns as indicated (see the photo I put macro)
But I have to change because everything was not in place.
It's good if this mounting ...
Thank you to everyone on this list
see you soon

2877. Group 3 pretests

Yahoo group: pfr3_group
Date: 2011-07-27 10:33:31 UTC
From: Grant
Topic: 2877 Message: 2877

Hi guys, I have just completed the alignment of the receiver (thanks Ray, VK4ZW) and have now just completed populating the board with the group 3 components. I have successfully carried out the pretests, but have one question: with key down, pins 1 and 13 should read about 2.5v. My power supply (gel cel) is putting out 10.31v and I read 1.5v and 1.26v respectively on pins 1 and 13. I presume these readings are within the accepted voltages, given my power source.

Regards

Hi Grant,

Sounds suspicious to me. I would chalk it up to a DVM square-wave measuring issue if it weren't for the fact that the readings on pins 1 & 13 will always be equal as they are -hard wired- to each other.

I'd recommend double-checking those measurements and if necessary perform power-off continuity checks of the U8 connections.

The signal on Pins 1/13 is a 5V, RF square wave. Depending on the responce of the meter used, it should read the average votlage of 2.5 volts. But so long as it doesn't read a steady 0 or 5, then something is happening and is okay.

Hello Steve and all
I finished the quick adjustment of the BFO, and the tone matches the Ten-Tec TRX pfr3 receives the good as well, but there is a small problem I think.
I plugged a wire sr R1 but it's no use, I do not mean much, even by setting C1 / C2. (Low) so I looked a little L1 and touching with the fingers I receive many CW is astonishing sensitivity, and even without the wire output Q1 - R1 51 ohm,
so I put a metal pin with hands on pin 1 of U1, OK strong signals in the helmet, also OK hotspot T1 and C2
even a little weak signals on the antenna 2 x 40 m! arrive in the pfr3, really strange. (Probably by the 10 V power supply for testing ...)
I am the way on the schematic and after 5 pF in C1 and T1 secondary is nothing ... and before T2 on OK
Even on the external antenna wire on R1 is low. L1 must touch ...
Can mean the impedance must be waiting for Q1 is in place?
I will continue to mount, but my first idea and it does not smell good for my transformer T1!?
or C79 ... I'll have to troubleshoot ... H. I.
Oh, there will be a good solution ...
I also feel that the measurements are disturbed as I go down with the key, the digits run, yet everything seems normal ... (HF may be)

Topic: 2877 Message: 2882

An update. I have now taken measurements on all pins of U8 and compared them to the table in the documents. This is what I measured:

Pin Rx Tx
1 0 1.82
2 0 0
3 4.97 2.15
4 0 1.72
5 4.97 1.98
6 0 0
7 0 0
8 0 1.58
9 0 0
10 4.98 2.15
11 4.98 2.16
12 0 0
13 0 1.86
14 4.98 4.96

Quite a few are not as they should be. Does this indicate a bad component?

And the adventure continues, I always hear the CW with the plate on the lab table mounting DDV, but only by putting his finger on L1 and points on L1/C3
Does C3 5 pF is a little weak? I would see the RX later, it is tuned to the frequencies LED display says the same thing on my TE-TEC and transmission CW is of course also as I work with the simple key.
(I understand the Electronic dash-called fast track in the earphone, but not to the issue in the T-Tec RX)
The "Before Installing L7 test" is OK, FEW test of volts is OK to test point its proper volts as indicated on the label.
L7 is in place and I continue to Group 4
What do you think?

2884. PFR3 Keyer

Yahoo group: pfr3_group
Date: 2011-07-28 11:02:20 UTC
From: Don McBride
Topic: 2884 Message: 2884

Hello Group,

My PFR-3 was one of the very first produced and has worked well from day number one with one nagging exception. Perhaps among the group, someone will shed some light on this.

The memory keyer "misfires" or skips dots, dashes or spaces intermittently. It sends find from the paddle but saved memories will come out different every time. The chip has already been swapped out with Steve Weber, as that was a bug in the first kits.

Has anyone been experiencing a similar problem with this otherwise excellent radio? I really like it and have made many contacts with it including DX, but the memory keyer is more senile than I am.

Thank you.
... 72,
... Don K3RLL

I wish everyone had a 100 MHz Oscilloscope! Since the active signal on the pins during transmit are squarewaves at 7 MHz, the voltage you measure with a voltmeter depends on how the meter responds to RF and how it loads down the gate. Apparently, the meter you have isn't very good for this type of thing.

The important thing is that there appears to be an AC signal on the pins and that thier not stuck high or low. Thats the important thing. Just proceed.

Don,

The problem with the keyer memory studdering was discoved well after the one or two obvious bugs were found in the very early release of the kit. You'll need to have the chip updated again to fix the memory send problem.

I wish everyone had a 100 MHz Oscilloscope! Since the active signal on the pins during transmit are squarewaves at 7 MHz, the voltage you measure with a voltmeter depends on how the meter responds to RF and how it loads down the gate. Apparently, the meter you have isn't very good for this type of thing.

The important thing is that there appears to be an AC signal on the pins and that thier not stuck high or low. Thats the important thing. Just proceed.

Thanks Steve, great insights for a learner like me! Much appreciated. I have just conducted a 'live' test in 'real' conditions. Hooked up the rig as it is to a dummy load, fired up my FT-450 and tuned it to 7.030 and sent some cw from the PFR-3 and heard it crisp and clearly from the speaker of my main rig. Beautiful. So I am satisfied that the transmitter is working as it should and will proceed. There is a qrp contest on Down Under on 3 Sept and I would love to participate with the PFR-3. But if I don't have it ready in time, I will fall back on my very trust DC40A.

Many thanks for your encouragement and advice.

From: f6ddv
Topic: 2889 Message: 2889

Hello again
I said you would laugh ... but you have the right, H. I.
The T1 transformer was mounted upside down ... primary instead of secondary
Of course it does not help much to receive weak signals ...
Now it repaired rather quickly, but I'll repeat a T1 to a better head, because this one has suffered a bit ...
Jump mounting the pfr3 will soon be completed, I would not mind if there are no other surprises ...
it's strange I have a lot of 7 0.1 ufd capacitor (104) I have left in too ... How strange, yet the assembly is complete and I can not find error in this regard.
missing some components, but this is not a problem for me, I have in the drawers.
A question:
Some ham radio among us seem to have a little afraid that the heat BS170 or do not support the return HF
They are totally in parallel, why not solder a fourth or fifth? below ...
It does not come out may be more power, because the exit at the group entry will be the same but it can work more easily? I do not know ...
I ordered a few of these transistors in France from a vendor who sold really cheap.
soon, 73 s

While the BS170 have a reasonably small gate capacitance, but put too many in parallel and they will start to load down the driver gates to unacceptable levels. I.E., load the driving voltage down so it is not high enough to turn the BS170's on enough to get to a low resistance condition, and that would make them heat up and burn up.

The number three is a good compermise between having enough, but not too many. There are two things which makes the BS170 finals so effiecent, one is the fast on/off time due to the square wave drive and the other is the low on resistance, both of which minimize losses which casuse heat.

Hello Grant and all
Well done the progress in assembling
I put only photos on the site pfr3, I already have enough errors, no need to write "long nonsense" H. I.
I already re-T1 ... H. I. (Laugh out loud ...)
I'm going back on the set because I just wedged the BFO with c16, so far I did not understand English the setting procedure, and I never saw the letters on the LED CAL.r display because I prefer not to be silly about it, I'll wait for the right measuring equipment Qualibre well, I think it's not very serious and that the default pfr3 works fine like that? ...
the tone is well in TX and RX is the same frequency as the big TRX as well.
But during testing I did not hear the CW dots and dashes in the large TRX, only in the earpiece ... curious ...
This is probably normal if the key works on the driver?
soon

2896. Audio Mod

Yahoo group: pfr3_group
Date: 2011-07-30 21:14:14 UTC
From: k6mgo@verizon.net
Topic: 2896 Message: 2896

Just ordered my PFR3A and was reading the manual, and some of the posting here, and see that when I do a search for "Audio Mod" I get many hits. I see everything from 1 UF to 2.2 UF and 10 UF mentioned.

Was wondering, what most guys used for the cap? I have minor hearing loss, mostly upper speaking range of 2KHz and above.

I would like to do the mod on the first build, so I don't have to take the board in and out of the case too many times.

Thanks for any help,

73,

Bill, K6mgo

I'd recommend leaving it as-is because there's a trade-off to increased gain: increased audio distortion. That 'mod' was for the early version PFR3 (no suffix).

If your hearing is OK around 700 Hz, where the PFR3A peaks, you should be OK. Actually, hearing loss at 2KHz might be a benefit in this application; rolls-off audio noise.

What earphones will you be using? If you have earphones that are relatively insensitive, that might be a reason to increase the gain of U4.

I agree, the Sony's are generally quite sensitive. I bought a pair a couple weeks ago on sale at Fry's and am pleased with their performance. The sensitivity is rated at 105 dB/mW.

I imagine that at the max. rated power of 50 mW the sound pressure level would be past the threshold of pain. I won't be trying that; the '60s were harmful enough. ;-)

From: va3ied
Topic: 2902 Message: 2902

Well I have had my PFR3A for a while now and am more than pleased...It is very simple to use and very rugged...my last trip into the North end of algonquin park I used it a lot with wonderful results just using the internal cells. It was a a nice night so before turning in I left the radio just outside the tent in the vestibule. Well, the rain storm from hell hit and we got a lot of wter. The radio got soaked and full of splattered dirt/sand. I thought all help was lost as when I picked it up, the led's were glowing randomly.

I took it apart in the camp and found a sunny spot. Took out the batts, dried them off and let the radio dry. After the wind, sun did its bit I carefully tried to blow out the sand and dirt. Put it back together voila, back in action. The simple design made theis rather crude field repair possible. Nothing miraculous I realize but still a testiment to this solid little rig.

I am back kayaking for a 7 day trip Aug2-9th and hope to do the same...but the rig will be stored in its little case

As for amplified speaker, I find the audio very good even with a normal speaker plugged in. If you need more, try the rechargable ihome mini speakers.

Hello Scott,

Removing the battery posthaste was the best thing you did. If you'd left it connected any longer electrolysis would likely have started eating up the circuit board.

I cannot count the number of times a customer has brought in a 'dunked' radio or mobile phone saying, "I tried a fresh battery but it still doesn't work." The result of that isn't a pretty sight.

Topic: 2905 Message: 2905

Hi guys,

Just a warning to those just starting out building this great little rig. I have just completed populating my board and will be doing the final tests tonight. But one thing that nearly stopped my momentum was a missing 470 ohm resister. I couldn't find it anywhere and was sure I had misplaced it because I noted I had checked it off on the BOM. Then I looked over the PCB and saw it there. What now? I then looked over the entire instruction manual and found that there should be 2 of these resisters, not one as mentioned in the BOM. Luckily I found one on an old disused kit in the junk box that I could salvage and reuse. So check your inventory well before it stumps you too.

Just a heads up.

Thanks for the tip, Grant. I'd heard people say before to check your inventory well before you start, so I did. Then I came to inserting a particular capacitor, and it wasn't in my parts tray. I had definitely checked it off on the BoM, so I knew it had to be there somewhere. Eventually I found it lying on the floor hiding behind the leg of the desk. I have no idea how it got there, as I was very careful to keep all the parts sorted in my tray, but if I hadn't checked off the parts up front, I wouldn't have known to keep looking till I found it. So, it is good advice indeed.

From: f6ddv
Topic: 2909 Message: 2909

Hello all
One thing surprises me a little on the coaxial output of asymmetric pfr3
If I look closely at the diagram, the output of the RF COAX since S9 is perfectly asymmetric mode with respect to ground.
Why go from there to the BNC coaxial plug wire twisted unknown impedance and symmetrical, and the influence of the line twisted
from the weight of the cabinet and the radiation from all other components and lines and can be losses and impedance break ...
I have the small coaxial cable, I think it would be better to use a coaxial cable asymmetric by making it run the closer
to the ground in the corner of the PCB and coffert?
It would even be possible to place the BNC coaxial plug at the far right next to the location of the PCB coax marked G,
and no need to coax or twisted cable, while the rest should be slightly modified but no major complications
This is not what is shown on the photo of the installation instructions that needs to be updated.
We do not see what is written, it is unfortunate in many cases missing photos to ham radio that does not fully understand what is said,
this kit is sold worldwide
photos remove all doubts in many cases
Your opinion?
Well, while waiting for answers to many of my questions I'll leave a little pfr3 rest and work in the garden ... H. I.

Topic: 2884 Message: 2910

Thanks to Steve KD1JV coming to the rescue, my very early model PFR3 is now working beautifully. The "stuttering" in the memory keyer, as it turns out, wasn't the fault of the aging operator but rather the logic chip. I was convinced that the solution was a new Begali paddle but now know it was "all in the chip".

Well, since I now don't need that new big-buck Italian paddle to use my PFR3, I guess I should send the cost of it to Steve?

Now if only that updated EEPROM could correct my CW spelling errors... Oh well.

Thanks very much Steve.

Hello everyone
I think I'm a bit becoming "goat" (French expression to say that I think my mental health may be at risk ...)
I think the little yellow pfr3 will be left far behind, because there are many things that concern me and I will have to take the problems one after the other,
because there is too much at once .. .
I look at the errata section on the site on pfr3, it is just about time I get to the end of the assembly!
and I am surprised ... this part is still valid?
I will not talk about anything, but I'm a little puzzled, there are strange things écritent I think or I misunderstood.
I see the value of resistors R6 R7, 470 K for me
there is an error that would be 330 K? I did not get a 330 K, I have in my boxes, of course, but ...
and there are other changes, it is called U9, U9 I can not find on the circuit design ...
It's starting to be difficult for me, I know that things will eventually, but right now there are more questions than answers in my head,
I should have finished this kit, even working very slowly it is difficult for me.

Hello,

With all due respect, you are over-analyzing the PFR3A.

The twisted pair jumper from the coaxial output jack to the circuit board is quite adequate and is not long enough to cause the problems you describe.

If it makes you feel better, replace it with a short piece of coaxial cable or move the coaxial jack to be closer to the PC board connection. I believe that there would be no measurable difference in performance. You could then use the hole left in the cabinet for a charging jack for the internal battery pack.

I will agree, for non-English speaking builders more and/or revised photographs might be helpful. Maybe you would write a French language manual?

Thank you Steve
(The "Steve" is my lifeline ... poor little French!)
Well guys, you need to know that I am very patient and very nice, if I accept everything said, for I am far from perfect ... H. I.
But as even the old versions, it's over, guys have built their TRX, I was not there but I guess it went well ... finally
But the manual is the same ... there are places that should be reviewed, it is not too difficult to change with new pictures with all the guys have released ...
I am responsible for web sites and also from anything, even Word and PDF creator does things very well and very clear, and current,
so you have to remove everything about the previous version, even html now possible and videos ...
Well, I stop here because there is probably a good reason.
The assembly of the double contact of origin, it's like but there is also more ...
Go Doug and the team, there are a lot of young radio ham who can manipulate files and who would do that to new and super modern for some goodies ... H.I.
I must say that the pfr3 work it out of the three bands on HF and consumes 600 mA in tune and the PA is loaded onto a big 47 ohm resistor
but it remains to make precise adjustments.
The BLT is also working on 40 meters but on the other it is difficult, and then my extension metal is not a good idea,
because the HF is in contact from what I see on the axis of the capacitors, we will have a third tube nylon, I have ordered from Doug because I only have 2 ...
I think I'll order something else and think before to see if nothing is missing and if no other errors ...
And as I already said, it is difficult as there are doubts and unanswered questions.
Go, and soon all 73

Ignore the errata on the web site. Although it does not say so, that errata list is for the original PRF3 (no suffix), NOT for the PFR3A.

Hello again Steve
Yes, I knew all this before ordering, and I totally agree with what you write.
I know everyone is good will and did his best, I have no doubt, but you are in USA and you quickly understand the things I put several days to understand,
because there are a lot of subtleties in the description and Sometimes we are facing a real wall.
But perhaps to avoid a "mountain" of issues and clients a little stressed, it would be simpler just to make the site more modern and up to date ...
And also the installation instructions that can be improved without much difficulty, I can assure you it is very important ...
Of ham radio in several languages should be consulted for this, and say this is not easy to understand.
It's much simpler then and there would be fewer questions,
I think this is quite logical and better for ham radio manufacturers from all countries that are not always comfortable with the English language
and technical editing and adjustments.
If I have problems, then I have already built kits is that there is something that is not well.
I think it would be easier to end a small business with less time to explain.
Well, it does not matter if I spend one more month, but it is understandable that discouragement may be possible for some people
with my best 73S

Hello,

Steve Weber is the person to go to for technical questions. He is the design engineer,
prototype builder, repair technician, hiker and all around good guy :-). He knows the
Hendricks kits better than anyone because he designed most of them!

Hendricks QRP Kits is not a big company with a building, employees, offices and
laboratories. It is one owner, Doug, along with a core group of associates (for lack of a
better term) all over the United States.

For what it's worth, I think Doug's business model is very clever and obviously successful.

It is not boring for me to hear the same questions over and over. That is what this Group
is for.

Best of luck with the remaining assembly of your kit.

Good evening again Steve
I say this about the coaxial cable instead of twisted pair wire is simply that I had problems with that on other devices.
But about a French manual, Steve, you kidding me? It should first cappable I am to understand correctly the technical manual in English,
which is not yet the case, otherwise I would ask no questions and I would just say "it's over and it works "
Thank you and 73s

Hello,

With all due respect, you are over-analyzing the PFR3A.

The twisted pair jumper from the coaxial output jack to the circuit board is quite adequate and is not long enough to cause the problems you describe.

If it makes you feel better, replace it with a short piece of coaxial cable or move the coaxial jack to be closer to the PC board connection. I believe that there would be no measurable difference in performance. You could then use the hole left in the cabinet for a charging jack for the internal battery pack.

I will agree, for non-English speaking builders more and/or revised photographs might be helpful. Maybe you would write a French language manual?

Well, when you are finished and it works (and I am confident that it will work) then you can simply create your own document, not just a translation of the English! I believe you are very close to finishing.

You say 600 mA in transmit? That is very close to rated current so it appears that your transmitter is working!

Steve Goodnight
Yes, it is finished, but it is not resolved and Qualibre as it should be, I still have to check the 10 MHz and the other points explained in the manual.
Also the sensitivity and the problem of T1 or I think it is easier to wind the coils in opposite directions 5 because in this way the wire is properly presented in four holes, I think being out of phase for this transformer should not be a problem but I'm not sure.
And then maybe some personal changes for the future.
Ah yes, it is 600 mA at 11.5 volts, resistance heaters put temporarily out well, I have to control the exact power with a real load VHF, I think I should not be further from the truth, I ' have been very careful the regularity of all the turns of the low pass filters, they are pasted below, and it will be to "play" with the turns required for the 5 W requested.
I wonder if the chillers are necessary drive power transistors, I have never seen such hot mos, I think it is not heat that kills them, but return a strong HF ... I knew I would see me reassure H. I.
I use google translator to copy and paste, but I have the original instruction at the same time because some things are much easier to understand directly in English.
There are even completely untranslatable words, and I have to check as I send an e-mail because it often happened that I was about to send enormities, or phrases totally incomprehensible.
I still have several problems, such as isolation required extensions of the axes variables capas, if I can not find the nylon tubes I should order, (a dozen at Doug and a few things) because I capas few variables of the same type of different values here for future projects home made QRP.
Voila
73s and soon to all the friends of the list.

Hello everyone
Pictures in the link below or I describe the progress of the installation with photos that can change, I show metal tubes to replace a tube on the variable capacitor nylon dual section.
http://groups.yahoo.com/group/pfr3_group/photos/album/1645504843/pic/list
Do not do this, it is a mistake, because the axis of the variable capacitor is connected to ground, it is not isolated, and when I tested the TX in tune with the BLT operation, I put my hand on the button I saw that the led was showing me a big difference in setting, because the button is not for the HF
so I will remove this mechanism and I just built a spacer to replace the missing with a piece of nylon coaxial cable that I cut the end of the button and everything will be okay.
I keep the settings and the end of the assembly quietly.

Hello,

Yes, the capactor shafts of the BLT are above ground so hand capacity could be a problem. However, you should be able to use the metal shaft on the preselector capacitor C1/C2 because the capacitor rotors are at ground. Hand capacity should not be a problem there.

Hello Steve
actually the axis of the double variable capacitor is grounded, and in theory it should not be a problem, just the test was done with the assembly without housing and with a single resistor of 47 ohm coaxial carbon welded .
it is possible that there have a problem to tune when RF present on the ground and thus ROS.
I said that the agreement was done well, the LED off, just the hand on the knob and removed completely changed the agreement,
the reference mass was probably not good, the screen does not exist (no case), so it's proven that it is better to use a single rod as is often the case in the boxes agree.
Once editing is complete the problem would not be shown.

The axis of the variables in the BLT are both hot with RF as C72/73 is in series with the TX RF ouput and C74/75 floats above RF ground by the winding of T3. The rotors of C1/C2 go directly to the PC board ground.

Yes Steve, I can see this on the schematic, but it does not explain why the ground potential is not neutral, it's probably my strength temporarily sealed,
and mounting on the table ... (yet in "wood tree" HI
as I would ascend the mount in the box after completing the settings more accurate, I would put the bird with the cap 10H and a good dummy load
at which time it will be the most serious.
since I introduced the three nylon tubes there is no problem.
I did not put glue I filed to the two capacitors fall flat and can not turn, is better.
But the BLT will able to give my resistance on 7 MHz, I think that this resistance is not very clear! as soon as I would have unsoldered
I put it on the impedance meter to see if it really is not inductive, but it is not very important,
I welded the resistance not to leave the line open and toast the MOS !

Hi, Well, I have begun fitting the completed PCB to the enclosure and installing the binding posts etc. My power jack is too large to fit into the hole provided. This means bringing out the rotary tool and attacking the metalwork. But I am having to do this with the PCB in place as it's quite a job to remove it now. Anyway, it might be advisable for those not yet at this stage to check theirs first and make the adjustment beforehand. The other problem I face is damaging the clear coat with excess heat from the drill because I have completed spraying the enclosure.

Hi Grant,

You don't need to hog out the hole with a rotory tool, simply scrape the paint away from the inside circumference and then the jack should fit easily.

good evening Grant
Check if it's not just the painting that narrows the gap.
Otherwise, you will not struggle to expand by hand, with a thick pair of scissors, turning and scraping cutters or some with just one hand or even a cutter, depending on the angle you provide slowly turning and following the hole, or a drill clamped in a vise grip by turning by hand
I can not explain, but it is quite feasible, the metal is not hard, I have enlarged the holes and dozens of times

Hello again Grant
Well, then it will go, and attention to paddle Jacq phone also there painting, but as you did with the small drill and the small round shape that's fine.
I tried several times to place the assembly in the yellow box to make sure everything is ok before Decalcit mechanical and varnish, it must also pass a little abrasive on the strut of the box to remove paint and be sure that the ground contact is well with the PCB at the screw, the screw threads will be not enough, it is better that the contact is good on the tip of the spacers.
For my part I finished the settings and I put up Decalcit,
(I'm a little afraid of these Decalcit, ahhh, shame about the serigrafie no longer made) I have a problem to choose the varnish spray pressure, because I do not know if Decalcit are sensitive to certain varnishes , and how to use in France?
If I know the chemistry aproximation brand of varnish that is cited by the guys and the record
For example: cellulose varnish or primer, varnish or other?

2936. Wiring up the internal battery holders

Yahoo group: pfr3_group
Date: 2011-08-03 10:17:59 UTC
From: Grant
Topic: 2936 Message: 2936

I am about to tackle the final stage of my rig, the wiring up of the two internal battery holders. One question: if I wire it straight from the holders to the connection points on the PCB, then it seems to me that if I need to remove the bottom panel from the top, I will be constrained by the length of the two wires used to connect them up. How have others found it best? Should I use connectors so I can just pull them apart to separate top half from bottom half of the enclosure, or isn't this really an issue?

Hi Grant, I, too, saw that as a potential problem, however, after use, it isn't much of an issue. Even with the radio on the bench for service, the extra connections would certainly make it easier. Maybe powerpole is the answer in some cases. On my own yellow box, it isn't an issue, once the batteries are in, and the holder was debugged, the batteries haven't needed attention. The case or holder was the issue, with its fastenings being intermittant. Good Luck, Have a great day,

Hello Jean Paul,
I built a PFR3A several months ago and could not find the Krylon Matte spray specified here in Alaska. Instead of Krylon, I used Rust-Oleum Painters touch ultra cover MATTE CLEAR. It was easy to use, and looks very professional. The finish is a nice matte finish.....NOT A GOLSSY finish and it seems to be durable. USE SEVERAL LIGHT COATS NOT ONE HEAVY COAT.
Rust-Oleum products seem to be available throughout the USA and even up here in Alaska. I think I have seen Rust-Oleum spray can products in the UK and Europe, but cannot say this for sure. Building supply stores, home improvement stores, hardware stores, etc all seem to have Rust-Oleum, but all may not have the MATTE CLEAR spray can. Possibly this is available in France.

good evening Rick
I think I'm fine look at what is, in fact, I have not seen this brand on the shelves of specialty stores.
What is important is 3 things (as well)
1 - thinner (gasoline) that is in the chemistry of varnish to keep it liquid before being sprayed with air, it must not attack the paint or the pfr3 Decalcit
2 - the varnish, it must be impact resistant and resistant to ordinary cleaning products
3 - I had not thought of, should not it shines, because it can be annoying, giving a matt varnish ...
So no matter what
Ah, the good times of the screen-printed yellow box is over ... H. I
see you later

Topic: 2909 Message: 2942

Good evening everyone

I just finished all the various settings before the introduction of pfr3 in his cabinet , Everything seems normal
I am amazed at the good reception, very sensitive with a simple piece of welding wire 2 m on 40 m band reception of some stations in CW is very correct
There are still some points to clarify for me, but lexture the diagram and explanations tell me that this is a very complete transceiver for low price kit
There are many things to discover, because I do not just build, try to understand how it was developed,
and is much more complicated than it has air, it's interesting.

The end of the setting is a bit surprising, I see the opposite of what is written on the output power
For exactly 12 volts on a load UHF perfect, is a bird wattmeter 43, the measurement is made with cork Bird 10H (2 to 30 MHz 10W),
N connectors and BNC cable of 10 cm.
40m> power = 4 W 580 mA
30m >power = 4.2 W 640 mA
20m> power = 5.5 W 790 mA
Current = 50 mA in receiving speaker
I can reduce the power in 20m with the torus in L12 tighten the turns, but for the 30m and 40 m the turns are well spread apart and regular,
and power can not be increased in this way, and yet I counted the turns ... t there is there another solution?
13-volt power goes almost 4,8 W on 30m and 40m

Well, the hardest is going to stay to the declac and varnish ... H. I.
then put in a box. and QSOs !!!

Topic: 2928 Message: 2945

After looking over the last two here for building, and finding them both, (an early and a recent purchase) the same as the others, i.e. the power jack, fits very nicely into the hole provided. Unfortunately, the threads of the jack, don't. The hold needs to be enlarged only enough to allow the threads to enter. And many times, I will very carefully enlarge that only enough to allow the jack to be screwed in. Thus allowing the jack to provide a bit of a ground also. The jack is the same in the early and the recent purchases. It doesn't appear the jack has changed. The one thing that has changed through the run of kits, is the amount of paint on the box. Some are heavy coated, some are light. Past that, they still remain a high quality kit that will provide a large amount of pleasure for the effort. Have a great day,

From: Ray Buck
Topic: 2946 Message: 2946

I seem to be missing C71, it must have been there in the beginning as my parts list has the 150pf caps ticked off.

My local parts store only have 150pf in ceramic not monolithic. I would expect that the ceramic could be substituted for the monolithic?

Thanks for any feedback.

Subject: [pfr3_group] AnotherPFR-3 on air!

Hi guys, well, we now have another great qrp rig on air. Last night I made my first qso with the pfr-3. I received 599 reports on 40 and 20m from Ray VK4ZW. I didn't try 30m as my ant doesn't tune up on that band. But I have no doubt I would have also received 599 from him on this band.
Thanks for all your help and encouragement. It is the best kit I have built so far (and I have built many). It is also one of the few that has worked first time!
I have updated my blog with pics.

Hello Grant
and hello to all friends list
You have my congratulations, I think you were very quick Grant !
For me, as I wrote, the final adjustments are completed, I find my power a little weak in 30m and 40m, (4 W) but other than that I asked the Decalcit last night and today I will to buy the varnish and wait until it is very hard and then put the assembly in the box.
Maybe I should find a support group list for the power before mounting in the box.
It is curious that in my kit is the 20m that was almost 6 W at the beginning of measurement, is that the capacitors in the low-pass filters can only play or the turns?
I just received a kit, O.H.R. The WM-2 QRP wattmeter which is a good kit and I think that can help to measure very small forces (less than 5 mW is possible) I did not have that opportunity.
with this and the new Elecraft I XG3 of becoming better equipped devices for good measures is important I think.
73S and soon

From: f6ddv
Topic: 2953 Message: 2953

Hello Bob, and also other friends list
For once I will send on both lists (pfr3 and QRP cw)
I try not to annoy the guy in a list with the affairs of another list, or why the two lists.
I saw that Bob asked for news of me and the pfr3
I say or I had arrived in the assembly and the small problems that remain to disappear for me, but some questions remained unanswered for several times, and I can not be more qualified than I initially then I ask specific questions but I'd rather wait and not go too fast.
I will not repeat my questions because they are on-line sites, here I'm not online that I am using Outlook, I will online only if I made a mistake or to view old posts or photos.
I'm going very slowly because I do several things in radio and also in construction work in the house ...
I finished the varnish on the case, after the decal is very difficult, I am a little nervous, and fortunately there are two cards to stick signs will almost 3 here, and the varnish, I am not satisfied with my work, I do not own it,
looking to further it will go ... H. I. I would not because the picture may be that this is not a good promotion ...
But never mind, tomorrow I put the assembly in the cabinet, and I would see if I understand how to increase the power of 40 and 30 meters, may be adding a spiral ...
Voila
73s to all and see you again

Hello,

How will you know if adding a turn to the 30 and 40 meter filter coils will not simply increases the harmonics?

You are close enough to the rated power output that the low indication could be measurement error.

Steve Goodnight
You're right, I do not know about harmonics, no one knows yet if the inductance is correct, but the harmonics do I know, just listen to their level.
I simply note that the other ham radio has too much power on 40m and 30m in the initial measures, and for me the opposite, and 20m I saw 6 W!, But it is the yellow cores when I try to study, I would seek to test and understand what is happening simply, I have not alternative but to test and measure.
for power, you read it with any device I have done so far, the bird 43 with the proper plug for the correct frequency range and provides 5 W playback settings of the scale, and ROS in turn showed 0 W, the load is good up to 1 GHz
My conclusion to my level of simple radio store TV is that the inductance is not correct in 30 m and 40 m may be missing just a half turn, no one knows without trying I think ... I have been paying attention, but I may have made a mistake on both torroids, or all, which may explain the difference of 20 m because the record says that it is generally much less (and myself is more ...)
I tried to put a ferrite on the inside, the power has not moved, I am not surprised, the magnetic field is closed.
Is my reasoning is completely wrong?
Thank you for your response and 73

Hello Jean Paul,

It has not been unusual for the PFR3 radios to have more power output on 20 than on 40 and 30. I don't know why and you should to go to the designer for that answer. Maybe the output filter on 20 has less loss? Maybe there are more harmonics on 20 which shows as more power output? I do not think that is true but it is possible. Also possible is that you made a mistake winding the toroids but again I don't think this is probable because it would be more likely that the problem would show up on one filter and not both. I also think you have been more careful not to make such a mistake. If you were not such an experienced builder then I would suspect a toroid winding error.

It is also possible that there are measurement errors using the Bird meter. I would suggest comparing it to a carefully constructed and calibrated RF probe. If the measurements agree then I would agree that your power output is somewhat low. You can also compare those measurements to the WM-2. That meter is quite accurate on HF.

There is some variation between cores. The cores I used to determine the number of turns years ago might have been slightly different from the cores currently supplied. There is also some variation in how the core is wound, real tight to the core or real sloppy.

If you feel you MUST get at least 5 watts out, removing a turn from L8 / L10 (the core on the PA side of the filter) will increase the power output.

Hello Steve
It's true I wonder if the cork is released with few copies in bird model: H 10 (2 to 30 MHz 10 W
Purchased from Henry Radio is really fair, the TRX other things it gives quite logical, as the DC30B 900 mW is quite possible. (To compare)
the cap is not linear? Is not very common among bird either,
but small powers may be limited for him, the WM-2 there is an amplifier and several scales, it is probably not by chance ...
I feel like I have put the right number of turns counted from the first community in the past, and it is the view of many as well.
But in fact this is not the first kit for me, I take my time and I do a little attention, I re control at least twice, and the cores are in their proper place.
But hey, this is not a disaster, it leaves much of the power and it does not seem self - oscillate either, the signal is pure on the RX station ... is an enigma ... H. I.
I will try to understand what is happening, I wonder if the side of the capacitors it would not be a problem because there is a mix of brands, they are not all the same type of insulating material in the filter passes down ... may be trying small capacity in parallel to see the reaction.
I admit that I'm surprised a little, but I'm not really worried, I'm rather interested to know the reason ...
I want to wait a bit before getting into the box, I'm not really in a hurry ...
I have not installed the kit WM-2 it just happened, but it's actually a serious wattmeter

Hello Steve and hello to friends list
I have something strange to tell, I now have 5 W of 14 MHz to 10 MHz and 7 MHz perfectly stable.
Trying to change L8 and L10, by spreading or compressing the turns that only reduces the power, nothing else.
But as I go up against the turns a bit by bringing them closer to the top of L9 and L11, everything is normal
I managed to have 5 W on 10 MHz and 7 MHz, the number of turns was not changed.
L12 and L13 were not affected, L12 slightly to reduce power: 6 W to 5 W on 20 m
The BS170 is not even warm to the touch with the tunes
power is about 12 volts
The more I read throughput is 770 mA
What do you think?

Re Hello again Steve
Well, ok, it's a bit short as an explanation based on your expert opinion of this great assembly which you are the Father ...

Just, you know that I have read anywhere that it is possible to change the turns on L9 L11 L13,
L8 L10 L12 only, then as I am not the best technique (and not in English unfortunately), I remained disciplined and stuck there by the fear of making a mistake.

I think I have to understand that the impedance on the side of BS170 was correct, but that's beside the 50 ohm load that was not the case
and that I should understand the need to adapt.
Thank you for guidance in developing this part of the assembly.

cordially

2963. Increasing the volume?

Yahoo group: pfr3_group
Date: 2011-08-07 23:06:27 UTC
From: Grant
Topic: 2963 Message: 2963

Hi guys,

Well, my PFR-3 is up and running. I was reading 4W out on 40 and 30 and 5W on 20, and decided to play with the windings of the coils to increase them all to 5W. This entailed removing the board from the enclosure, which was tricky given the wiring up of the sockets, etc. Nevertheless I found that bunching the turns tighter together so they occupy the upper half of the cores did the job nicely. Now I get 5W (or just about as close at it gets on my MFJ Versa Tuna meter). But now I may have another issue: it seems to me the receive volume is much lower than it used to be. For instance, I had a QSO with Ray VK4ZW, also on a PFR-3 and only about a mile away from my shack) and on 40m I had my volume and RX Peak at max. He was at a comfortable audio level in my headphones. Previously he would have split my ear drums, forcing me to wind back the RX Peak and vol due to sig strength and distance. I also tuned in to sigs further afield and compared them to what I could hear on my FT-450, using exactly the same ant and ant settings. Seems to my ear that the PFR-3 is about half as weak on receive.

Has playing with the coils affected receive volume, or is it more a factor of solar flares or conditions? Anything else I need to check?

Regards
Grant VK4JAZ

2964. assembly of pfr3

Yahoo group: pfr3_group
Date: 2011-08-07 23:13:53 UTC
From: f6ddv
Topic: 2964 Message: 2964

Hello everyone
The assembly of small yellow pfr3 is now complete
The various problems encountered have been resolved, the last one was a poor screw banana plugs balanced outputs, you see the news photos.
(impossible to tighten the nuts, the screw is not exactly the same, I can throw them away)
I have replaced with new business models, it's no big deal ...
Otherwise, the power has remained the same, largely on the three W 5 bands
reception is good, the BLT works well with a simple wire a few feet with a ground wire the same as well, which is a good sign.
Overall the installation went well, I think a little of myself to some problems and you will see that the internal wiring is slightly different from the original.
Missing components, but many others was extra in the Kit
I would not use the blocks provided for batteries, I prefer to weld cell LiIon battery type later and also add a connector for the external charger.
Can also add an amplifier and a speaker for the headphone output is a little weak.
The photos of the installation are available below

Grant,

It seems to vary from PFR3 to PFR3. Some say that their receive volume is just fine. Like you, I think mine is on the weak side. I know a lot of it depends on which earbuds or headphones you use; but in any case, I have resorted to also using a Boosteroo AF amplifier. It really helps.

Just a note to all. Like Grant I found that the power jack would not fit to the existing hole. I had to use a tapered hand reamer to enlarge the hole. Not a big problem as if taken steadily it is an easy job and doesn't damage the paint work.

> Hi, Well, I have begun fitting the completed PCB to the enclosure and installing the binding posts etc. My power jack is too large to fit into the hole provided. This means bringing out the rotary tool and attacking the metalwork. But I am having to do this with the PCB in place as it's quite a job to remove it now. Anyway, it might be advisable for those not yet at this stage to check theirs first and make the adjustment beforehand. The other problem I face is damaging the clear coat with excess heat from the drill because I have completed spraying the enclosure.

Hi Grant,
I'm thinking that the crossed winding of L1 will affect the rx, however, I'm not sure that they would make the rx sens or volume drop off like it did for you, as you only optimized the tx power, by adjusting the L8-12 toroids. Do you have any background noise or is it just very quiet? Since you've got it back together, have you used it on 40? How does it sound there?

Topic: 2969 Message: 2969

I completed the build of the PFR3-A on Friday 5 August 2011. For a number of reasons I took my time for the build. The rig worked as advertised; not quite 5W on 40 but near enough.

My first QSO was 0n 40M, QRP to QRP (PFR3 to Elecraft K1), about 730Km or 454 miles; my second QSO was into Invercargill New Zealand - a distance of 2497.7 km or 1552 miles) with a 559 report. My 4 plus Watts against 400 Watts. Needless to say I was quite pleased. My antenna is a modified all-band doublet at about 6 Metres.

I'm looking forward to taking the PFR portable.

Thanks to Steve for the design and Doug for the opportunity to build and own such a great the kit radio.

Subject: [pfr3_group] assembly of pfr3

Hello everyone
The assembly of small yellow pfr3 is now complete
The various problems encountered have been resolved, the last one was a poor screw banana plugs balanced outputs, you see the news photos.
(impossible to tighten the nuts, the screw is not exactly the same, I can throw them away)
I have replaced with new business models, it's no big deal ...
Otherwise, the power has remained the same, largely on the three W 5 bands
reception is good, the BLT works well with a simple wire a few feet with a ground wire the same as well, which is a good sign.
Overall the installation went well, I think a little of myself to some problems and you will see that the internal wiring is slightly different from the original.
Missing components, but many others was extra in the Kit
I would not use the blocks provided for batteries, I prefer to weld cell LiIon battery type later and also add a connector for the external charger.
Can also add an amplifier and a speaker for the headphone output is a little weak.
The photos of the installation are available below

http://groups.yahoo.com/group/pfr3_group/photos/album/1645504843/pic/list

Hi Dale
On 40 I do have good background noise. But playing with the RX Peak hardly makes any difference. It did the first time I used the rig, but not any more. I think I need to pull out the 30m torroid and redo the soldering, and may as well rewind L1 while I have the board out. Perhaps that will do the trick.

Do you have any background noise or is it just very quiet? Since you've got it back together, have you used it on 40? How does it sound there?

Congratulations, Ray, very good. I'm sure you will find that you won't miss a lick of fun with it...
not to mention, you won't miss picking it up after enjoying it all outing long.
Good DX, and maybe one day we can do a 323Q.
Have a great day,

Subject: [pfr3_group] Completed build of PFR-3a

I completed the build of the PFR3-A on Friday 5 August 2011. For a number of reasons I took my time for the build. The rig worked as advertised; not quite 5W on 40 but near enough.

My first QSO was 0n 40M, QRP to QRP (PFR3 to Elecraft K1), about 730Km or 454 miles; my second QSO was into Invercargill New Zealand - a distance of 2497.7 km or 1552 miles) with a 559 report. My 4 plus Watts against 400 Watts. Needless to say I was quite pleased. My antenna is a modified all-band doublet at about 6 Metres.

I'm looking forward to taking the PFR portable.

Thanks to Steve for the design and Doug for the opportunity to build and own such a great the kit radio.

Hi Grant,
If it is a band by band issue, then individual toroids maybe the solution, and one place to check may very well be T1 or L, and it may pay to check the soldering around the rx ICs too. (U1 or 2)
The tuning or peaking on 40 is broad, and the peak gets sharper on 30. But the peaks follow the numbers on the panel pretty well. IF it doesn't maybe a check of the trimmers of the cap would be in order, after working over T1 and L1.
Good luck,

It would change the peaking a little bit, the half moon look is when you only see a half circle of the trimmer. I "half moon" them all. IF you can't peak the rx, then yes, it would affect the rx volume. Do the voltages around U4 look good?

No, shouldn't. You say it sounded fine before fiddling with the LPF coils.
I'd check the T1 connections, maybe one broke with the handleing. Or maybe a
missing solder connection someplace. Could have been working due to a
friction fit at first, but then opened up when moving the board around.

Or you could move the turns back more to where they were on the LPF and see
if that makes a difference. Might be you improved power output, but moved
the knee of the filter below the band and attenuating receive signals now.

Without an actual, calibrated signal source its a bit hard to subjectively
qualify signal sensitivity.

Hello to all and Grandt
I found some questions about problems in finalizing I met exactly the same.
- Not enough power in 30m and 40m
- Hole too small
- Questions about setting up and taken to ensure your T1
and others ...
Maybe a little memo on these boards before the builders stop ham radio installation for several days, scratching his head would be nice for the friends list?
There is also an update of the installation manual that is online, but we will blame me for taking care of me that's not my business be?
I'll just answer on my solution for these problems:
Grandt, you do not say on what you have worked torroid
Pou me was exactly the same problem, too much power and not enough on 20m 30m and 40m
the instructions advise to work on the turns of L8 L10 L12
(L8 and L10 for 40m and 30m) and nothing else.
This action is not brought to my pfr3 it is only possible to lower the power, these reactors are on the side of BS170)
The solution for me was to trace the turns of L9 and L11 to the top of the torus
These cores are on the side of the antenna load and power is passed easily to more than 5 W, it must be very careful.
Concerning the meaning of the winding 5 turns of T1, I also asked, for indeed if the coil 5 turns in the opposite direction outputs appear perfectly in the holes, but I was stuck in my editing I chose to meet in the wires seem to "make loop" (see drawing)
and these wires are passed through a single hole in the ground,
son to the other two L and S as described.
Maybe if we reverse the direction of the winding 5 turns the result is the same, but I did not want to test this, I had already pretty late.
there are some changes I wanted to do the wiring and other, I will answer questions from modest ham radio manufacturers on the technical reason as I used.
photos of my installation are on site, hot hypertext below
I think I will make a key double saw blade that will fit the prf3 like the one pictured on the site, but simpler, method A or B is not useful for me, I am one "small "in Morse, H. I.
http://groups.yahoo.com/group/pfr3_group/photos/album/1645504843/pic/list
Good day to all and 73S
jean paul F6DDV

Hi guys,

Well, my PFR-3 is up and running. I was reading 4W out on 40 and 30 and 5W on 20, and decided to play with the windings of the coils to increase them all to 5W. This entailed removing the board from the enclosure, which was tricky given the wiring up of the sockets, etc. Nevertheless I found that bunching the turns tighter together so they occupy the upper half of the cores did the job nicely. Now I get 5W (or just about as close at it gets on my MFJ Versa Tuna meter). But now I may have another issue: it seems to me the receive volume is much lower than it used to be. For instance, I had a QSO with Ray VK4ZW, also on a PFR-3

and only about a mile away from my shack) and on 40m I had my volume and RX Peak at max. He was at a comfortable audio level in my headphones. Previously he would have split my ear drums, forcing me to wind back the RX Peak and vol due to sig strength and distance. I also tuned in to sigs further afield and compared them to what I could hear on my FT-450, using exactly the same ant and ant settings. Seems to my ear that the PFR-3 is about half as weak on receive.

Has playing with the coils affected receive volume, or is it more a factor of solar flares or conditions? Anything else I need to check?

Regards
Grant VK4JAZ

Hi Larry
Normally if the impedance of the headphones is good power is ample, 16 ohm or more is not good, 8 ohm's okay in my opinion, a careful record Jacq mono down in the second "click" does not sound and is a short-circuit output.
On an 8 ohm speaker means well, but it is a little weak
Indeed, an amp or other exterior ipod can be useful

It seems to vary from PFR3 to PFR3. Some say that their receive volume is just fine. Like you, I think mine is on the weak side. I know a lot of it depends on which earbuds or headphones you use; but in any case, I have resorted to also using a Boosteroo AF amplifier. It really helps.

It's true Ray
This hole in the power plug is really too small
should be tested before painting if possible
Jacq holes (painting)
BNC hole: remove some aluminum
hole external power: remove a lot of aluminum
see you soon
F6DDV
It is good to scratch the paint on the inside to make visible the aluminum before the introduction of power and BNC plug
(HF ground contact can make the problem, the reference ground potential should be the same)

Just a note to all. Like Grant I found that the power jack would not fit to the existing hole. I had to use a tapered hand reamer to enlarge the hole. Not a big problem as if taken steadily it is an easy job and doesn't damage the paint work.

thank you Paul
I try my best to work, and especially what is important is to show his version to friends and give the results and explain why it worked this way if a ham radio asking.
I think it's important that you follow the schematic of the assembly and try to think and understand what each element, and what solution can be made to the problem which may be different from that of other ham radio.
I made the mistake of not carefully check the electrical schematic pfr3a at the start and I missed an obvious solution

Hello everyone
This is an important issue that requires a little patience
we can indeed set to amplify the noise, the maximum noise is not always the solution, it is a mistake, try to produce a very weak signal
with a small xtal oscillator or signal generator, and try to increase the signal and check if there is a maximum increase of the signal and lower noise
The signal + noise divided by the noise is not simple, you need a small generator and lots of patience and can succeed in making the assembly
more efficient than others on a small signal can be, it's a great chalenge interesting.
I remember that I changed the transformer and the small binocular TRX DC30B and the circuit of the tuning capacitor,
and I ended up getting a more powerful receiver with less noise on small signals, it's very interesting , it is always well rewarded for his patience.
see you soon

Very interesting Dale
This is the kind of exchange on this list very useful
This answers one of my current issue, as the agreement of the peak frequency of 20 m is very close to the mechanical stop of the condenser double,
probably every ham radio is not exactly the same processor and the distributed capacitance in the coils is not the same for all
it is possible to adjust the trimmers two half moon for two circuits of separate agreements on one side and the other capacitor 4.7 pF (or 5) to improve this?
can be a little variable capacitor instead of the 5 pF would be interesting to try
Thank you and 73s

You can certainly adjust the trimmers to any position that works best for you, but I have found leaving the trimmers to the "half moon" adjustment, and making the toroids tune correctly is a better total solution. The winding of the toroids, on cores that may not be exactly the same each time, has much more variance than capacitors that are physically identical.

Hi Dale
It is true that act on the toroids seem more effective, I will try this for the problem of the agreement too close to the stop on 20m, it should be possible but the sensitivity of my pfr3a seems to me good or I'll try to quantify the threshold of sensitivity, I still work in microvolts ... dBm and I have not yet used to play with.
Oh, by the way, the "head" of L10 L8 here for 5 W in 30 and 40m ... 73s from F6DDV

2985. Mounting LED Module

Yahoo group: pfr3_group
Date: 2011-08-08 22:20:20 UTC
From: k6mgo@verizon.net
Topic: 2985 Message: 2985

I think I know what I'm doing, but, would appreciate some reassurance, just in case.
I recall reading a post by Carey, K2RNY, where he said to just insert the LED Mod leads into the holes, and then mount the ckt. board to the top cover with a couple of screws and tack the corners of the Mod.
I am assuming that I don't need any more clearance than for the red filter, so, the weight of the module will come right up to the cut-out in the top cover, and make sure it's centered, RIGHT?
Thanks for any help,

73, Bill, k6mgo

2986. On air again and T3

Yahoo group: pfr3_group

From: Grant
Topic: 2986 Message: 2986

Hi Guys,

I pulled out L11 and rewound it. Now I get a good solid 5W out on 30m. While I had the board out, I changed the twisted 'coax' cable for real coax and took a look at T3. I used the enamel wire for winding this core for the two wires that connect to the binding posts. Do you think this could be a problem? Should I have used the hook up wire provided with the kit instead?

I tested the rig last night and had a good qso on 40m with a ZL. He gave me a solid 579 so it seems to be working fine business now.

Hi Grant,
I would be concerned that the solid enamal wire, would have a tendency to break with vibration. The hookup wire is stranded and will withstand vibration better.
And good on L11 rewind, that is exactly what happens almost every time there is an issue with sensitivity.
Congratulations, Way to go Grant!!

Hi Bill,
Yes, that is the procedure, the red lense is so thin, it isn't an issue, especially if you don't snug up the board real tight before tacking in the corners of the led to the board.
Good luck,

Subject: [pfr3_group] Mounting LED Module

I think I know what I'm doing, but, would appreciate some reassurance, just in case.
I recall reading a post by Carey, K2RNY, where he said to just insert the LED Mod leads into the holes, and then mount the ckt. board to the top cover with a couple of screws and tack the corners of the Mod.
I am assuming that I don't need any more clearance than for the red filter, so, the weight of the module will come right up to the cut-out in the top cover, and make sure it's centered, RIGHT?
Thanks for any help,

73, Bill, k6mgo

Hello Bill
and good morning to all
For my part, I preferred to introduce the LED display and also led the BLT and ask the printed circuit board with 4 screws.
Do not forget to place the red filter temporarily.
Then we take time to see if the display is flat at one end, and gently pressed with your finger on the tip of the display of legs,
as we verified that lies flat on the red filter the box, is placed gently on two supports and can weld the legs of the display.
the legs of the display are almost flush with the PCB, you feel just the tip of the legs with your finger.
this way the display will be snug on the inside of aluminum, and then to mount a rule can be sure that no component exceeds this height.
I led for the BLT is exactly the same by checking it over just right, and then there is no problem for the implementation.
see you

Hi Bill:

Good point and apologies for not being more specific. I also placed the red film over the hole in the cabinet before I got started mounting the LED. I used some clear tape on the ends to hold the filter in place.

Good luck. I am in Virginia on vacation with the family as I write this and hope to get on the air with my PFR-3A this week.

Hello Grandt
And good morning to all
I did not notice of realignment since the start box, it is of course possible if the son, etc. are brought close after the completion of assembly,
or simply the presence of a greater mass of the case, the frequency is to adjust again, I do not seem impossible.
For the rest, I did not really understand the value of the control settings other than 10 MHz of 10.0000 which is here on the counter portable
(very specific, nothing to touch)
audio frequency is defined as one listens to the ears of the frequency filter that is the best, (the one that spends the most QRO in the filter)
and a receiver control is the same
I think this is the offset for the friend contacted is not obliged to shift? it is not easy to fully understand what is explained to me,
so I simply put the same key to listen the same station that I listen at the same time on my Ten Tec using the VFO trimmer,
and the frequency displayed on the pfr3 is the same as the T. Tec, so I guess it's good?
To offset this problem a bit strange, because it depends on how often audio CW Om the other listens,
I prefer to listen to 600 Hz, this is not the same frequency for all ham radio.
Maybe I would have to review the settings after a QSO if the stations are shifted for me or if I have too often to RIT ... I prefer to wait a bit.

Hi JP,

Comme avec n'importe quel kit, si vous avez déjà une autre Transciever et une charge fictive que vous pouvez faire cette expérience vous-même pour voir si votre décalage est correct.

[As with any kit, if you already have another transciever and a dummy load you can do this experiment yourself to see if your offset is correct.]

Hello Lynn
Yes, it is quite true
The kit provides explanations standard but we are free to do differently, of course, and construction is the same, if a ham radio thinks he can change something for his own peace or because it 's used to work in a different way, it is free of course.
As for me, I found it difficult to understand the method of adjustment, sometimes it was very simple and you just have to let the kit as it is and just adjust the frequency, the setting is inside the default is good.
There would be some improvement with photos in macro mode and a few other details in the text but I never come back the top, pfr3 works first time here by a few things not very difficult to repair with the aid of people on the list.
I put the story of my pfr3 in photos like some other ham radio, so the guys know we can build successfully in many ways and have a pfr3 that works well.

2996. Reverse paddle sense...a question...

Yahoo group: pfr3_group
Date: 2011-08-12 11:38:35 UTC
From: John Farmer
Topic: 2996 Message: 2996

Hi All,

I've been looking to build a PFR-3 for sometime and I'm poised to put one in the shopping cart, but I have a question:

I'm left-handed and use reverse paddle sense. On my other rigs, I can implement the reversal in firmware and on my Weber Dualbander, I simply rewired the paddle jack. Easy.

But in the PFR-3, paddle sense is not reversible in firmware and I can't see how I would do this mechanically, as the paddle jack looks to be a modular unit that solders directly into the PCB, so there are no wires I can simply swap around like I did on my WDB.

Anyone know an elegant work-around for this or do I have to bite the bullet and rewire my paddle cables for use with this rig?

And while I'm here, I'll ask another question - what is it that makes the resolved CW audio sound so great on these rigs? I've been comparing the audio, through headphones and speakers, of my Weber Dualbander and an Elecraft K1 and there's no comparison: the audio from the WDB is crisp, clear and very well articulated. It has a precise "punch" without being harsh. The signals just seem to pop out of the band noise and are so "clean" and defined compared with my other rigs in which the resolved audio is, by comparison, rather soft and "mushy" and floats against a generally higher level of band noise. I know this is subjective, but I'm amazed and over again I return to my little red WDB if I just want to listen around. I think the PFR-3 will be the same.

Thanks for any advice about the paddle sense,

73,
John

With a sharp hobby knife, one could do a bit of surgery on the board, and reroute the paddle. If you intend to use the paddle that has been made for the PFR-3, the wires for the paddle can be reversed, on the paddle. Or, you stand alone paddle could be wired to work out right,

There is a resistor in series with each paddle lead going to the processor and are located right next to each other. You can revese the paddle sense by "crossing" these resistors. The easiest way if the resistors are already in place would be to remove one and re-install it on the bottom of the board, so the two resistors don't have to lay on top of each other. Bascially, you will change the resistors to make an "X" instead of being mounted | | Makes sense, no?

> And while I'm here, I'll ask another question - what is it that makes the
> resolved CW audio sound so great on these rigs?

Two things. The use of the audio band pass filter and a lack of excessive audio gain. The audio filter in my rig designs eliminates most of the high frequency audio hiss and helps "peak" the CW note. The audio amp after the filter has modest gain, so what high freq noise which does get through does not get overly amplified. I know some of you with hearing loss think the audio is annimic, but for most of us it provides the best signal to noise ratio.

A rig like the K1 has way more audio gain then it really needs and no audio band pass filtering, so the signal to noise ratio suffers, making weak signals much harder to hear dispite all that audio gain.

A simple option would be to make a short paddle adaptor cable that swaps the dot and dash wires. With that it would not be necessary to modify any rig nor any paddle.

I have a question about the alignment in Group 2 smoke test:

If you have done CAL.r, then locked it in by pressing Menu or Keyer (see both referred to for S1), and then turned off power. If you want to later go back and do CAL.o, you have to start over and go through CAL.r once again, if enter CAL.r, just press S1, without touching anything else, has the settings for CAL.r reverted back to default, or, stayed at the new settings you made the first time? In other words, do I have to readjust CAL.r every time I go into and out of it, or once set, does it stay set?

Thanks for any help.

Thanks everyone for the helpful ideas. I think I'll just cross over the resistors during the build, as Steve suggested. I didn't think about that as a possibility when I was pawing over the schematic. The adapter cable is a good idea too. Lots of options. Thanks all.

Thanks too, Steve, for explaining the design behind the excellent audio. I have youngish ears and excellent high frequency hearing, so I notice these differences between rigs very easily. Your tricks in the audio chain certainly work and render a clean, articulate audio with plenty of attack and outstanding S/N. It's one of the main reasons I'm buying a PFR-3 for backpacking, though if it's anything like your DualBander, it'll get a lot of use on the desk at home too. Thank you,

73,

John

Topic: 3000 Message: 3003

Thanks for the input, Dale. I used my K3 to align the DDS. I have the K3 within a couple of Hertz of being right on 10.000 Meg. Then I tried to use Spectrogram 16 to align CAL.r & CAL.o. I was able to use audio coupling between the PFR3 and my Netbook, via a speaker hooked to the PFR3. The BFO read 500 Hz and the Sidetone read 600 Hz and it was easy to adjust the BFO trimmer to be right on top of Sidetone signal.

Wasn't able to adjust the band pass centering yet though. When I get the band switches in and can go to 30meters, I can tune in WWV and see it on Spectrogram 16 then it should be easy to adjust.

Thanks for your help.

You have to start all over. The default values are loaded when you enter the cal modes. This in case the data gets corupted, so you always start with known good data.

Thanks for the reply and explanation, Steve. Using Spectrogram I am now able to do the Group 2 alignment in less than 5 minutes, so it's an easy matter to redo any time.

Hi Bill,

How exactly do you connect the PFR-3 up to Spectrogram to do the alignment? Do you connect it via the audio output jack on the rig and IN via the mic/line in on your computer's soundcard? I see in the manual there's mention of tapping the product detector audio from one of the IC pins. How are you doing it with the PFR-3?

I've just ordered my PFR-3, so I'm having a look at the manual and this was one point in the alignment process that wasn't that clear to me.

Thanks for any info or alignment tips!

73,
John

3007. Power out low

Yahoo group: pfr3_group
Date: 2011-08-15 18:26:40 UTC
From: k6mgo@verizon.net
Topic: 3007 Message: 3007

Finished the build, and measure 5.0 watts out on 40m but only 3.6 watts on 30m and 2.4 watts out on 20m.

I see I wound L10 and L12 to take up at least 90% of core, so, can't see spreading out the coil anymore.

Anyone have any suggestions to boost the power on these two bands?

Thanks for any help,

73, Bill, k6mgo

from being a long time monitor of this list, I can tell you that this is
normal; output is always lower on the higher bands, and your figure is
within spec considering the accuracy of most wattmeters. I wouldn't worry
about it a few dB of power; with QRP it's all about the aerial, anyway.

73, Terry

Thanks Terry,

I should have said I was measuring the power out with a Elecraft Dummy load and RF probe and measuring the voltage with a Fluke 110 DVM. so, I feel my measurement is pretty accurate, not like I was using a SWR/Power meter.

So, do you still think I've got about as much power out as I'm going to get?

Hi Bill,
With the initial power out that you have, it may turn out well that you adjust the bandpass filters now. I suspect that there are differences in the cores, that in specific and individual radios, will force one to either remove or add a turn to get to the specific power out desired. A drop off on 20 maybe noticed but you can certainly work through it, with adjustments of the toroids. Try squeezing or spreading first, that usually gets the power set up correct.
Congratulations on a successful build,
and have a great day,

OK Dale,

I'm going to give it a try, as I can't spread out the turns anymore, on L10 and L11, I'm going to compress them a bit, and see where that takes me.

BTW, just made my first QSO on the PFR3 with our mutual friend Dale, K6PJV, up in Sacramento, from the Los Angeles area, using my indoor antenna in the garage rafters, on 40m.

Hi Bill, I also had similar readings to you. I found that the tinning of the ends of L10 was not up to scratch so I removed the coil and rewound it. Then I found on 20m I was getting more than 5W out so I played with the coils of the right hand side of the board until I got 5W. The other bands required bunching of the coils until they occupied around half of the core. Now I get a shade under 5W out on 30 and 40 as well. That's about the width of the meter's indicator arm, so I am happy. And now it's easy to make contacts too. Real easy.

Good luck with the build; I'm sure you are going to love this rig. I haven't used my big rig at all since completing the PFR-3.

Very good Grant,

You remind me of a post I read, but can't find again, where someone said that he compressed the turns for the coils on the left side of the board, and spread them out on the right side, to increase the power out, or, just the opposite, can't remember just exactly now. And by the way, I'm assuming you refer to the right side while looking at the bottom of the board where the coils are mounted?

Hello Bill
Hello everyone
If you have a good look at the list, Steve KD1JV to talk about the possibility that the characteristics of the cores could be different, in fact, is the iron powder, and according to the manufacturers is possible, unfortunately there are copies ...
Steve knows what he's talking naturally.
I should have measured with the LC meter inductance as I finished the windings is the only way to know, I build more and more small measuring devices, because it is difficult to know what we if you do not speak the exact value of the inductance, I have other tori here because I make home made montages, the same references and T37-2 T37-6, I could measure and winding two, but I do not want to unsolder those in place on the pfr3, and then maybe Steve to the value of inductance which was originally planned, but we will not know if the cores that are in place are same.
it does not matter because we happen to have the right value and to obtain the normal power.

Topic: 1361 Message: 3017

On page 15 of the manual it states to install a "DPDT" Toggle switch. to the rear of the cabinet. This part is not listed on the Parts List, nor was it supplied with the Kit.

I emailed "sales@hendricks" but haven't heard anything yet, and don't know it anyone got the word.

I'm just about ready to put my PFR3 into the case and need the switch, ASAP.

Hope the right person reads this, and can send me the switch.

Also note that the manual calls out for the installation of two 470 ohm resistors, but, only one is listed on the Parts List, and one supplied with the kit.

Tks.

73, Bill, k6mgo

Hello Jean Paul,

You are absolutely correct, about the Inductance varying from core to core.

I have now "fixed" my low power output on 30 meters, from 3.6 watts with 12V supply, to 4.9 watts. My 20 meter output is next to be fixed, I hope.:)

In case anyone is interested, I finished the kit with 5 watts on 40m, 3.6 watts on 30m and 2.4 watts on 20m. This was with a 12V, Gel Cell battery for power,and measured voltage across a 50 ohm, 20 watt dummy load with rectifier, by Elecraft, measured on a Fluke 110 DVM and calculated power output.

First, as suggested by others on this list, I tried spreading and squeezing the turns of the two coils, L10 and L11 (for 30m). The most effect seen was about half a volt across the dummy load. So, took one turn off of the coils, one at a time, and measured output. L10 didn't have much effect, but, L11 did, and now I'm right at desired power output on 30.

Am going to tackle 20 meters now.

73, JP and group

its too bad annoyances like this really take away from a great radio...I had oodles of extra everything parts on my kit...it was like the parts were shoveled in...still good value for money, however. I ran mine all week in algonquin in a variety of conditions and it performed great. I think he sourced out the parts counting/filling kits to kids!

And depending on which paddle you press the WPM will go up or down.

Subject: [pfr3_group] Question about Menu

When I click the Keyer/Menu sw, I get a "C 2.0" on the display. Is that normal to use 2.0 for 20 WPM? Because it is sending at 20 WPM, not 2.0 WPM.

Tnx for help.

Hi Ren,
Yep, that all sounds like it is supposed to.
Setting the speed, with the paddles, and the speed readout to start with, sure nuff.
You're good to go.
Sounds like you're making a giant leap ahead!!

Thanks Ren and Dale,

Yes, it's coming together nicely now, I have 4.9 watts on 40m and 3.3 watts on 30, (going to go back and add that turn I took off of L11, I think) and I got 4.7 watts out on 20m. So, pretty close to buttoning it up, still have the decals to put on, though.

Hi there Dale,

Hope all is well by you. Things here are cruising right along. I tried making contact with W2S today (Woodstock Event) but the weather has just been so lousy that, I know the signal dropped off by the time it hit the end of my street.

I'll try to give you a call before the weeks out.

Be well,

Ren

3029. RE: [pfr3_group] Re: Question about Menu

Yahoo group: pfr3_group
Date: 2011-08-18 02:09:09 UTC
From: Dale Putnam
Topic: 3023 Message: 3029

HI Bill,
Just a thought, the way I put the decals on, is with the cover, not connected to anything - radio.
Then I transfer the decals, and after they are plumb dry, and smooth... exactly where I want them... although many times I find one needs to move a bit, and it can with a drop of water to soak it for a minute or two.. then reposition... then dry.
But then, I wanted something to make the decals a bit more permanent... and I found that two coats of ClearCoat, either satin or gloss.. will do that..
let each light coat dry nicely before adding the next... I usually stop after two or three coats... the decals will stay put now.
And it looks nice. Well, I think it does....
Have a great day,

3030. Two Fine Foxii Fit to go!!

Yahoo group: pfr3_group
Date: 2011-08-18 13:05:42 UTC
From: Dale Putnam
Topic: 3030 Message: 3030

Two Fine FOXii are fit to go, all set and ready... hiding in the 20 acre woods, somewhere near 14.060.
We're halfway through the Summer Season, and all is well.. the game warden is happy, and the
hounds are at the ready....
So tonight, at 0100z 19 Aug, or 7pm MT, the hunting horn will sound, and the pelting will begin..
Have you been pelted? Are you in the running for TOP HOUND?
Or some are running with only the tip of their nose up....(qrpppp, that is, with 10 mw or so)

A fine pair of FOX, and my best wishes for a successful run and to each of the hounds a hearty
GOOD LUCK,

It's a Fine Day for a Fox Hunt!!

>

The decimal point is turned on in the display driver routine. It would be a pain to turn it off when not needed, such as displaying the code speed, so it stays on. Therefore, 2.0 = 20 wpm.

Yes, I have... and depending on the quality of the connection at each spring it will be either less than a tenth of a volt.. up to 4 to 6 volts or even higher.... that condition, is garunteed to worsen, until you fix it. Soldering is very very delicate as the plastic melts quick, recrimping has been somewhat successful, and soldering a wire onto the spring half way out, running it down the middle of the spring, then over to the next connector, works somewhat too... Some are easy... and some are really easy.... to replace.
Have a great day, hope it isn't a bad deal for you,

That's what I was afraid of. When I had my FT-817nd, I changed from AA's to an RC Car 9.6V 2000-2200 mAH Battery packs. They fit in the same space as the 8 cell AA's and had welded tabs so there was no drop across springs. And the best part was, they only cost about $17 for the pack.

I wonder what that .8 to several volts cost in power out from the PFR3?

The voltage drop, if less than a volt total, won't hardly be noticable... but if it gets up to the 5 or 6 v range.. the radio gets really hungry and quits playing nice.

3040. Back panel wiring

Yahoo group: pfr3_group
Date: 2011-08-21 19:08:39 UTC
From: k6mgo@verizon.net
Topic: 3040 Message: 3040

Got a question about wiring the back panel.

As I was shorted the DPDT switch in my kit, which is used to switch the output either to the coax or binding posts , looking at the diagram on page 15 of the manual, which show the switch, but,contacts are not labeled, and it shows the jumper from the BNC going to the left end of the switch.
Also the picture of the original PFR3, pg. 16, shows the blue switch with the jumper going to the left side of the switch, from the BNC center.

I bought a DPDT at Radio Shack, and it looks exactly like the picture on pg. 16, blue, but, the arm of the switch, is the center pin and not the end pin.

On the schematic, it shows the jumper going from BNC center to the arm of SW 11.

So, can I assume that the schematic is correct and I should wire the jumper to the arm of the DPDT sw?

Thanks for any help.

Functionally, either way will work.

One thing you do need to be aware of is that not all DPDT switches are not the same. Before you wire it, check the continuity of your switch to determine which contacts are connected depending upon the handle position.

The switch which should have come with the kit also has the common on the center pin. However, since this switch is used in a simple on/off configuration, jumpering the binding post to the center pin and the coax hot pin to the other switch contact makes for a shorter, neater, more direct physical connection.

Nice work jp!
My red binding post came with deformed threads (very shallow). Of course the nuts would not tighten and I tried to rethread it but ended up using one from my junk box.
Removing the paint around the BNC is an obviously smart move. I don't think the manual mentioned that.

Thanks Steve, that's the way I finally wired it up, and now have it in the box, buttoned up and get the following power out into a 20 watt dummy load, and reading the voltage across it with a RF probe and DVM, on 40m 4.7 watts out with 12V Gel Cell, 5AH
30m 5.0 watts
20m 4.9 watts out.

using AA Energizer(till I get some NiMh packs) I get
40m 4.4 watts
30m 4.6 watts
20m 4.4 watts
The nice thing about the dry cells is they have 1.5V out vs. 1.2 from the NiMh cells.

Thanks for a nice project.

My kit came with the same problem on the Red Binding Post, Steve, Doug must have a whole lot of bad ones. I also found a useable, although not matching spare in my junk box.

Also the nice thumb screws that he sent for the bottom cage, don't thread in. Too tight, maybe they are metric and not 4-40.

The DPDT switch was missing from my kit too.

But, got it working and all buttoned up, with full power out both on internal AA's (Energizer) and ext. 12V Gel Cell, so all in all I'm pretty happy.

Hello everyone
This paddle is beautiful and certainly also very strong.
but I liked the simplicity of the paddle that came with prf3 and lightness.
The supplier or the manufacturer of Doug would they agree to continue to build and sell ...
in kit form
I was very disappointed as I knew he would not be delivered.
I do not understand, it is always visible on the web site ...

Hello
thank you
No, I am not better than the others, I'm just trying to make a clean and try to see if what I do can make something better.
One must always try to do his best to friends and present something beautiful, to make them want to do even better, because it is often possible.
It is not always the case, sometimes you do better and think they are wrong, and you have to recognize it and stay humble and listen to the advice
of people who know compétances.
I think I'm learning and I progress because I have made many mistakes and accept to remember and correct them, and also with the advice of other ham radio.
It's just so that I can learn, it's very simple.
A friend once told me, it is impossible to learn as we already know everything ... because then it no longer listens.
Just kidding, of course, but it's so true is not it?
soon

3053. [pfr3_group] 500-900 Hz Acoustic Resonance CW Speaker

Yahoo group: pfr3_group
Date: 2011-08-23 12:06:51 UTC
From: lahagar1@aol.com
Topic: 3040 Message: 3053

For fun I made a speaker enclosure from a 16 oz. plastic party cup. I calculated the acoustic resonance to be 730 Hz, and measured a damped response passband of about 500 to 900 Hz -- making it ideal for use as a CW speaker!

http://www.youtube.com/user/NG9D?feature=mhee#p/u/12/XN8FUr0m1Po

Of course this has nothing to do with our great PFR-3A, but the results were so good and the cost of the project so little, that I thought you guys might like it too.

Hello
Instead of doing a lot of holes in a box and put the speaker behind, try to make a slot the width of a hacksaw blade.
On a slightly less than the width of the speaker, the case must be closed! the slot is not easy to do, or else with a small disc special,
and that's a lot of dust, and attention to your eyes!
try listening to the speaker alone, or behind holes
and try with the speaker behind the slot ...
you have a LF filter with a huge increase in the power of the note on a frequency close to 600 Hz

Hi Bill,

I use 34 feet of wire on a 20 foot, telescoping crappie pole, and 15 feet for the counterpoise. The wire is the same used for pet fences.

The radio tunes up on all three bands. I got the idea from Lynn NG9D.

Here's the link to the Youtube video:

I'll try the screw method. I also had to ream out the BNC hole with a rat tail file to get the connector to fit. Somehow some fillings shorted out the bs170s so I have them on order from Mouser.

My kit came with the same problem on the Red Binding Post, Steve, Doug must have a whole lot of bad ones. I also found a useable, although not matching spare in my junk box.

Also the nice thumb screws that he sent for the bottom cage, don't thread in. Too tight, maybe they are metric and not 4-40.

The DPDT switch was missing from my kit too.

But, got it working and all buttoned up, with full power out both on internal AA's (Energizer) and ext. 12V Gel Cell, so all in all I'm pretty happy.

I've run a rethreader, down each one, for the same reason, there is one on the back of the case that is very poor, in a large number of cases.
But the good news is, they clean right up, no problem.

And here the plastic buttons that make the screw heads to close down the box of pfr3 have any "skipped" like fleas one by one ...
I'll put a few drops of glue and cyano and maybe I would not have to crawl in the grass to find them ... H. I.
I ask myself another question:
How the mass of the bottom of coffert is made?
not easy, can be a ground lug on the inside and a small braid to be on the basis of coffert is correct to the ground potential,
because when I put the ohm meter on it it was isolated ... and I do not want to scratch the paint on the outside and star washers
between the two is not very practical to put every time either.
Ah, that little thing below is inexpensive and it accepts and amplifies many accessories in the CW, free port here,
I am satisfied with the sound is very good and 1 W of power.

3066. BLT problem?

Yahoo group: pfr3_group
Date: 2011-08-23 21:27:06 UTC
From: k6mgo@verizon.net
Topic: 3066 Message: 3066

I think I have a problem with the BLT tuner, but, it works in some cases, so am not sure, it's the tuner, or me.

First, I hooked up a doublet, 67' long, fed by 300 ohm TV lead-in to the binding posts. Toggle switch toward coax, coax/BLT to BLT and HiZ. on 40m it showed a complete darkening of SWR LED. But wouldn't darken at all on 30 and 20 meters. This same antenna worked just fine with my ZM-2 tuner and 100 watt Z match tuner from Internet to a FT-817nd and FT-857D.

Now, just tried a Random wire to red binding post, 33'5" long. 17' wire to black binding post. Toggle switch to binding posts. coax/BLT to BLT and both HiZ and LowZ. On 40m, was able to get complete Darkening of SWR LED. On 30 and 20 meters, not able to get slightest darkening, either HiZ or LowZ.

Note! the wires are spread out indoors, second level,approx 10' above ground.

Amy suggestions or help, appreciated.

67' dople feed with 300 ohm line isn't a good idea. Doesn't give you a good impedance to work with on any of the three bands. The ZM-2 might have enough range to match it, but I bet the losses are large.

You'd be better off shorting it to 44 feet and then you should be able to match it on all three bands.

Same with the so called random wire. 33 feet is 1/4 wave on 40 and 1/2 wave on 20, so you should be able to match it with low Z setting on 40. On 20, the feed impedance will be too high for the BLT to match. You need to lower it by making the wire either a bit longer or shorter. It will not be possible to match on 30.

For matching all three bands, avoid 1/4 or 1/2 wavelength for any of the bands. 51 feet seems to work pretty good for all three.

Not to confuse folks, but I have black, red, and yellow caps for the screws for the BBW and the PFR-3, caps with screws, or caps for the screws you have.
Seems that postage and 40 cents would do it. And a first class postage makes it less than a buck.
Contact me off list.
Thanks,

Hello Bill
There are some of your explanation I understand very well.

First, the tuner BLT will not all work, I think to limit impedance that will not go up to 1000 ohm for example, I think it is fair support but is not a box full of understanding.
You must take your tests calmly considering what you have to give, you write that you have a doublet fed with 300 ohm, and you put the switch to coaxial,
already it will not work because it is immediately symmetrically to the bananas and tune out and look for the BLT Agreement.
If you come to a complete off the LED, your BLT works well, but there are no miracles, there are bands or it will be outside its scope impedance and it will add an impedance transformer or correct a little antenna, or change the output mode, it is possible that in this asymmetric works best with a ground wire in L or simply balanced by band.
Hi Z and Low Z also changes everything, one of them will go to the correct impedance, but not the other, I tried several bands, and I saw that for an antenna or a wire,
if you change band can not always be on the same output mode, AC works better with a wire to a tape counter and the other is no longer good at all we must try something else.
You can not compare the tuning circuits of a transceiver like the FT-817 with pfr3 I think, and besides, the 817 needs a box to agree, as you write,
then maybe the pfr3 also in some cases ... but it pfr3 a BLT to help ...
Have fun with your pfr3, I think it is completely normal.

From: k6mgo@verizon.net
Topic: 3070 Message: 3070

Thanks for the reply Steve, I just doubled back 6-7 ft. of the 33" + wire on itself, and tried again. This time 40m band SWR LED out completely on LowZ, 30m SWR LED did dim, but not go out on HiZ, and 20m couldn't get a match on HiZ or LowZ.

So, guess the wire doesn't like working indoors. I'll have to try it outdoors and make sure it working alright.

Think I'll use my MP1 Super Antenna for indoor, clamped to the desk here upstairs in the house. That worked FB on the FT-817 and FT-857.

Hello Bill
Yes, the explanations give a bit of confusion in the mind at times, I agree ...
So you can imagine for me ... English ... on some things I caught a headache and went to bed hoping that it would be better the next day ... HI,
fortunately Steven proficient and some other friends told me of another more direct way for me because I was even about to implement the errata
that is on the site ... and date of some time (just an example for me)
The list is simply indispensable, otherwise the disaster.
As I am very strict in my movies it makes me sick just minutes from the time ... H.I H.I.
In fact it's very simple, it is the explanations are complicated for me ...
Very good exercise for the Frenchise ... H. I.
But this assembly is a jewel in its conceptual design, really very complete, many options as you look good, and it leaves the opportunity to ham radio
to mount to his idea, and there is room for work, we must recognize that for that price is good, I recommend this set to all the world like I have been advised
I could do another kit, there are many, but this one has some something special, it is a pure assembly ham radio at the same time mounting a very reliable
once you get the idea.

Steve, Are you suggesting using a 51 foot long wire? Doesn't this present a pretty high impedance on 30M which as you indicate at half wave lengths would be hard if not impossible to match with the tuner? Could you clarify. Looking for a long wire (with or w/o counterpoise) to use on 20-30-40 meters.

72, Steve KD1JV

Hi Steve,

Well, I built the 51' wire and with a 17' ground wire, went out on my skinny little patio and set up with a 31' Jackite Pole for support, at the front of the patio/lot.

The Jackite Pole is at the junction of the garage roof and portico roof, a low point of the two buildings, only single story high, and the 51' wire is loosely wound around it, coming down to just above the roof line, where it comes straight over to the rig, at an approx. 45 deg angle. The buildings (two story) really come close together with our house, at this point, and my neighbor on the left, only about 10' apart. The ground wire goes over to the left, and across the bushes behind me for the 17', approx. 2-3' above ground. (I sent this to your QRZ email address, with a picture showing the setup, but, it came back as undeliverable)

40m- it tuned up with LED completely out on HiZ, and almost out on LowZ

30m- couldn't get the LED to even dim, on either HiZ or LowZ

20m- LED almost went out on HiZ, was not the brightest, but never dimmed, with Tune control at max CW, and no change in brightness on LowZ.

So I'm thinking that there is nothing wrong with the PFR3, but more than likely the proximity of the two buildings, or maybe my setup.

Any suggestions?

Thanks for your help, I really appreciate it.

From: Steven Weber
Topic: 3074 Message: 3075

Err, okay. The 51 feet was actually for use with an L tuner with the wire streached out over a tree limb. Wrappng the wire around a jackite pole will change things a bit, even though it is loosely wound.

Finding a length that will work on all three bands might be difficult. 30M really should have it's own sperate wire length.

I would suggest trimming the wire back maybe a foot at a time to find a length which will match well on both 40 and 20 and hope it will do something on 30, unless someone else has found a magic wire length to use on all three bands...

Steve

3076. End Fed Antenna Length Study Spreadsheet

Yahoo group: pfr3_group
Date: 2011-08-25 18:10:38 UTC
From: lawresh
Topic: 3076 Message: 3076

I just uploaded an Excel spreadsheet I worked up several years ago. (See End Fed Ant Study.xls in the files section) The spreadsheet is setup to calculate wire lengths on increments of 1/8 wave. The purpose is to help select an end-fed wire length that stays away from the 1/2 wave length points (or multiples thereof) on the bands of interest as these lengths will present a difficult-to-match high impedance.

The spreadsheet was inspired by an article written by G3CCB and published in "The Antenna File" a number of years ago. The author sought a wire length that did not fall on a 1/2 wave length point on several bands of interest and therefore was easier to match. The idea is to pick a length from the chart that does not fall on or close to any of the 1/2 wave length points for your selected bands.

The spreadsheet is setup for band centers, but is easily modified for your favorite band portions.

Enjoy!

Hello
for long wire we hear about 85 feet, 43 feet, 21 feet
the ground wire is often better stretched "L" above the ground rather than on the floor
I tried the wire along with the balanced outputs from two leaving son in "V" of 21 feet or 13 feet at an angle of 45 degrees or more to trees,
it works well sometimes and even from the output BNC unbalanced .
often a ferrite core transformer with primary in coaxial cable and 2 son in output, 1 / 9 helps a bit to give better long wire,
I tested this, you may have to try.

Steve, Are you suggesting using a 51 foot long wire? Doesn't this present a pretty high impedance on 30M which as you indicate at half wave lengths would be hard if not impossible to match with the tuner? Could you clarify. Looking for a long wire (with or w/o counterpoise) to use on 20-30-40 meters.

3080. Using BLT with coax antenna

Yahoo group: pfr3_group
Date: 2011-08-26 00:54:42 UTC
From: k6mgo@verizon.net
Topic: 3080 Message: 3080

I am trying to understand the use of the BLT in the various positions and purposes That it was designed for.

Just setup a Super Antenna MP-1 with a single elevated radial, marked off for 40, 30 and 20 meters.

Tuning the MP-1, (similar to the Buddistick) I can get resonance on say, 7.030, of min. SWR of 2.6 to 1.0, as measured on my Autek RF-1 Analyzer. According to the manual, page 19 it says, "the S8 is used to switch between a direct coax connection to the BNC jack or the BLT . The Coax position is of course used if you are using a resonate, coax feed antenna or an external tuner. The BLT position is used when the built-in tuner is desired and is normally used with ladder line feed antennas, but, can be also be used for end feed antennas or possibly matching coax feed antennas which need a little tweaking."

So, lets say I want to get my SWR down to 1.4 or so, so I want to "tweak".

So, this is what I've come up with for switch positions to do this, please tell me if I'm wrong.

S11 Toggle to Coax
S8 BLT/Coax to BLT
S9 LowZ/HiZ what ever works
S7 must be in Tune position to see dimming of LED.

With setup as above, I tune Load Slowly, for dim of SWR LED in both HiZ and LowZ. Never see the slightest dimming.

Also try same procedure with Tune control and same results, nothing.

Do I understand this correctly, and am I doing it correctly?

Thanks for any enlightenment on this procedure,

73, Bill, k6mgo

3081. Re: [pfr3_group] Using BLT with coax antenna

Yahoo group: pfr3_group

From: Steven Weber
Topic: 3080 Message: 3081

The BLT/COAX switch on the TOP of the case needs to be in the BLT position. The Toggle switch on the REAR of the box must be switched to connect the bananna jacks over to the Coax jack. If wired as shown in the manual, that should be with the handle tilted towards the bananna jacks.

Since your coax feed and already down to 2.6 : 1, use the low impedance setting. Tuning will be VERY sharp with Tune and Load very interactive. Peak Tune for best Rx noise or signal, then try to get a dimming with Peak. If not, tweak Tune a little and try again. Keep working back and forth until something happens. It can take a while to find the sweet spots.

From: lahagar1@aol.com
Topic: 3074 Message: 3082

I found a 34 ft wire vert with 15 ft counterpoise tunes on 3 bands. CP connected to ground terminal, ANT wire connected to ANT terminal, antenna switch pointing at them (not the coax), tuner turned on (BLT) and impedance set to Hi-Z on all three bands. This is demonstrated on 40 and 20 here: http://www.youtube.com/user/NG9D?feature=mhee#p/u/5/3kWvXJ_5XgE (This set-up would also tune in Lo-Z on 30 and 40 but was a bit more touchy.) I like the 34 ft size since it is fairly easy to get it postitioned vertically or nearly so. As a full quarter wave on 40m it is good, on 30m, also nice antenna. And on 20m as an EFHW it is a superb low angle radiator.

Anyway, what I have not tried yet wtih the PFR3 is is an end fed antenna without the counterpoise. I think this might even be a bit more efficient and convenient. I willl try that before winter! I have done this with the IC703 and MFJ L-tuner wtihout counterpoise seemed to work pretty well even when in a compromised position: http://www.youtube.com/user/NG9D?feature=mhee#p/u/48/JD-DjQuL7bk

With a doublet, I used a 50' fed with 50' of homebrew parallel wire feed (probably about 100 -120 ohms) also connected to balanced line terminal posts. This antenna tunes on 40/30/20m also in the Hi-Z position on all three bands as shown: http://www.youtube.com/user/NG9D?feature=mhee#p/u/6/qaUN9m2u1pQ This antenna is made with two 75' pc of insulated wire, taped together with plastic tape at the center and at 2 ft inervals to make the feed line. No soldering and light enough to be held with small diameter PVC tube. (Actually I think 50 feet of feeder is a bit excessive for a portable antenna, you can see in this set up all that extra feedline was strung back and forth on the deck railing.)

Here is another example of the 50 ft doublet antenna , on 40m with the 100 ohm narrow-spaced HB feeder wire stretched out a bit more, still tuning in the Hi-Z position: http://www.youtube.com/user/NG9D?feature=mhee#p/u/4/7F8SUjiI5Zw In the second installation, the feed line plus the two antenna elements actually form the three guys that keep the support tube upright.

I have had no probems with the PFR3A tuner -- great design by Steve.

For matching all three bands, avoid 1/4 or 1/2 wavelength for any of the
bands. 51 feet seems to work pretty good for all three.

72, Steve KD1JV

Hi Steve,

Well, I built the 51' wire and with a 17' ground wire, went out on my skinny little patio and set up with a 31' Jackite Pole for support, at the front of the patio/lot.

The Jackite Pole is at the junction of the garage roof and portico roof, a low point of the two buildings, only single story high, and the 51' wire is loosely wound around it, coming down to just above the roof line, where it comes straight over to the rig, at an approx. 45 deg angle. The buildings (two story) really come close together with our house, at this point, and my neighbor on the left, only about 10' apart. The ground wire goes over to the left, and across the bushes behind me for the 17', approx. 2-3' above ground. (I sent this to your QRZ email address, with a picture showing the setup, but, it came back as undeliverable)

40m- it tuned up with LED completely out on HiZ, and almost out on LowZ

30m- couldn't get the LED to even dim, on either HiZ or LowZ

20m- LED almost went out on HiZ, was not the brightest, but never dimmed, with Tune control at max CW, and no change in brightness on LowZ.

So I'm thinking that there is nothing wrong with the PFR3, but more than likely the proximity of the two buildings, or maybe my setup.

Any suggestions?

Thanks for your help, I really appreciate it.

Yes they do, UPS is fine stuff. Ok, I'll be back in touch when I get it on the bench, after the clear coat paint goes on.
The battery holder inside has an issue also, but I'll work on that. Some of the early ones can be corrected. If not, then
I'll get a different one.
C U soon,
Have a great day,

3087. Tri-Band Longwires for 20, 30 & 40

Yahoo group: pfr3_group
Date: 2011-08-27 00:06:23 UTC
From: ac0owinco
Topic: 3087 Message: 3087

I have found a length of long wire which will work on all three bands and get a match using the PFR-3. 25 feet seems to work. Any longer and 20m will not match. Any shorter and 40m starts to look like too hard. And even if you can match, the antenna may not perform well on 40. Antenna worked well on 20 & 30 (made contacts with gud signal reports (579). Haven't worked anyone on 40, yet. But will. OBTW, the antenna was only 10 feet off the ground!! Sure to do better in a tree.

3088. Re: [pfr3_group] Tri-Band Longwires for 20, 30 & 40

Hello all

I feel very different lengths with different results are found in ham radio, and in me too.
Maybe it's the counterweight that is different or ground also different.
I just built one self to put in series with the ground wire + a capacitor in parallel to the output, I added a 12-position rotary switch.
The ferrite core is like a FT125 recovery, I put 30 rounds spaced 3 mm 1.4 mm wire, the switch is a 12-position,
I spend 1 µHenry to 450 µHenry, it can be tested for antennas son also short but I have to try to balance the ground wire or long ...
It is never made and yet it works sometimes.
MFJ at things like this just ready fictional land called I think, i am not sur is the same shématic montage .
I already tested, we can see the difference on the signal rise and also the ease to give the BLT and the antenna analyzer.

(I'm looking for a small metal box!)
See You , jp F6DDV

Hello Mike
I do not know to whom the question, probably for all the world ...
Normally it takes three wires counterpoise
But often it is a quarter wave of the greatest wavelength,
and often less as you can not connect a long length of wire, that is why we often have the HF on the mass of the housing of the transceiver,
and all cables are connected to the mass of case,
and because of this that I test a tuning circuit to be set to the counterpoise wire antenna.
The last test it showed that ROS decreases and performance is better by putting a tuning circuit in series with the wire that serves as a counterpoise

Understand that a counterpoise is part of your antenna system.

A 1/4 wavelength counterpoise is 1/2 of your dipole either suspended very low or laying on the ground.

The effect of 1/2 your antenna (counterpoise) laying on the ground is (at least) half your power wasted.....Into the ground!

All this monkey business of making a wire easy to load up can result in QRP becoming QRPPPPP.

For best RF efficiency, get that (so called) counterpoise up in the air....I mean WAY up...It radiates!

Get it up high enough and you will have a doublet.

Make it at least 3/8 wavelength for the lowest frequency, feed with ladder line or twin lead, tune it with your BLT and you have
an efficient multiband system.

Can't get it into a straight line?

Get the center up as high as possible and droop the legs down keeping them as far apart as possible.

If you are forced to use one leg as a (counterpoise) then keep that leg up high. Run it up to a tree but certainly don't lay it on the ground unless you are determined to
warm the worms!

Don't believe? Stick the end of your counterpoise on your tongue, hit the key, call CQ, call 911.

Just discovered a problem with my PFR3A.

Went to store a "CQ" call into memory, and it started out alright, but, by the "de and my call" it added a bunch of extra characters.

Tried about 4-5 times, with same results.

What's the fix for this?

Mike,
I did not use a counterpoise with the 25 foot long wire. The 25 feet went up to the top of a table umbrella ~10', then horizontal. As long as you get the high current part of the antenna up a ways, it works fine. That will make this length marginal at best on 40m.

Problem with that Dale, is I don't have a email address for Steve. I tried to send one to his QRZ address, but it bounced.

I'll just have to wait till he see this, and I'm sure he will contact me.

Also noticed that the adjusting keyer speed works backwards, DOT decreases the speed, not increases it.

Have a nice weekend,

Hi Bill,
The speed adjust isn't as simple as the paddle wired backwards is it? (I'd bet not, but I had to ask) As for Steve's address, I copied him, maybe he has a thought as to the memory storage followed by random stuff.
Good luck with that, I'm thinking it may be a reprogram of the uP.

Hello Steve
I totally agree with you
But you asked what kind of conterpoise?
So I assume that the person can not use a dipole and only a long wire.
Of course as a doublet with a line parallel Fedder is better, of course that a wire placed on the ground is a waste of HF it is better to be a little high.
I even wrote some time ago what to do wires from the two banana plugs for output symmetrical "V" and hang in the trees was the best thing.
The proof is that in a hotel with two yoyo wires of 6 m and a wooden floor on the floor I did the best QSO a few hours before in nature with a wire to the ground and another in a tree, but there was only one tree ...
as there are two attachment points I am making a "V" or "L" with two son and it works much better ...
and then a small vertical MP1 and four small conterpoise, but fixed on a table above the ground, it's better for the higher bands for the low bands sometimes feed near the ground is better, but with an almost shocking baloon the SO239 antenna.

So long and 73s

Bill,
I have made hundreds of QSO's from Alaska, Europe, UK, and around the "lower 48 states" with a 26 ft wire and a 17 ft counterpoise laying on the ground. This was with my Elecraft KX1 running 1 to 2 watts. I have not yet tried this combination with the PFR3A, however I suspect it would easily load this set up. I also carry an 8 ft lead with a big clip and sometimes also a 33 ft wire. Often in campgrounds I just clip onto the metal legs of the picnic table, chain link fence, or other metal and forget the counterpoise wire. This set up seems to do great on 20 and 30 meters and is OK on 40. If the counterpoise is elevated sometimes the rig does not load on 40, so I just use the 8 ft clip lead to lengthen the 26 ft wire, or lengthen the 17 ft counterpoise. If I want better 40 meter performance occasionally I use my 33 ft wire for the antenna and the 26 + 8 ft wires for a counterpoise (40 meters only). For home use or prolonged operation I erect better antennas. Please post your results.....this may not be the ideal antenna for the PFR.

Grant,
Possibly the stereo jack on the PFR does not "like" the mono plug. Try a stereo plug with the hot key contact hooked to the tip and the ring and sleeve tied together and hooked to the key ground terminal. Just something to try. Rick KL7CW

I also like the idea of the counterpoise lying on the ground. Still have to try it, but I like it. I think of radial wires on a vertical; they are on the ground or even in it. I'll let you know my results when I get around to trying it.

Hello to all friends list
Put a single Jacq pfr3 to the key is not a problem, it is detected the software knows right away.
For an "eternal beginner" like me the right key is the best as I "tape" the following key in my head it's better than the paddle that does "not speak" as well.
But put a Jacq mono headphone to ear is not good, it is an adapter with stereo Jacq, or we must mount stereo Jacq all cables connecting all the tips and the first contact, or it just push just the first "click" in and things are going well.
see you soon

Hello All - I thought I would weigh in on the question of longwires and counterpoises. After i built my pfr a few years back, I experimented with wires an found that 55 ft and 1/4 wave radials for all 3 bands worked FB. Even with my prevoius qrp portable rig, a mfj 9020, I would often rig up a dipole as a vertical with one side on the ground - I have worked the world with this config - and no worms were harmed....so the idea that a quarter wave radial and LW ant wont play does not match MY experience. I often do qrp from the pacific ocean beaches where vertical lw's play very fb over the salt water ground. NEXT summer, I wanna try a 20 m vertical yagi made of magnet wire hanging from nylon cord... 72 de John, HC7/K7HV

Thanks for the suggestions, Rick, I'm going to try them all and will report back with the results.

Ideally I can find one length that will load on all three bands, and be pretty efficient on them, as well.

I tried the 51' but that didn't work for me. So, we'll see what does.

Thanks again, and 73,

Bill, k6mgo

3112. End fed wire

Yahoo group: pfr3_group
Date: 2011-08-30 17:31:51 UTC
From: k6mgo@verizon.net
Topic: 3112 Message: 3112

Just to let those interested,know, I built the 34' wire, with the 17' ground wire and was checking it out this morning on my patio. I suspended it from the Jackite Pole, and led lt straight to the rig, no winding on the pole. It tuned very well on 40m but, couldn't get it to tune on 30m or 20m.
Then I shortened it to 28', (another recommeded length)and got it to tune on 40m and 30m but not on 20m.
Last, I shortened it again to 25' and again it tuned on 40m and 30m, but not on 20m.

So, don't know if it's me, or, if is the tiny patio, with two, two story buildings so close by, that de-tune it, but, so far not able to find a length that will work on all three bands.

73, Bill, k6mgo

Hi Bill,

Thanks for the info. That arrangement did for me on all three bands, the 34 ft wire as vertical as possible and both wire insulated. I recall using the BLT in Hi-Z setting on each band - although I could get the Lo-Z setting to work on 40 and 30 too, but more difficult. Tuning was sensitive, but once a match was found, it remained set with completely darkened LED.

Yes, Bill I agree the surroundings will influence the tuning, and maybe my particular installation had something to do with it. -- You caused me to remember that, about 20 feet away or so, there was a free-standing TV tower of approximately same height as the antenna wire which must have had some influence!

Also, I do also agree with the previous posting that said the CP may waste energy, and so I would like to try other antennas with as little CP as needed; maybe only enough to bring the impedance within range of the tuner (?). Sounds like more fun in the backyard, weather permitting...

Subject: [pfr3_group] End fed wire

Just to let those interested,know, I built the 34' wire, with the 17' ground wire and was checking it out this morning on my patio. I suspended it from the Jackite Pole, and led lt straight to the rig, no winding on the pole. It tuned very well on 40m but, couldn't get it to tune on 30m or 20m.
Then I shortened it to 28', (another recommeded length)and got it to tune on 40m and 30m but not on 20m.
Last, I shortened it again to 25' and again it tuned on 40m and 30m, but not on 20m.

So, don't know if it's me, or, if is the tiny patio, with two, two story buildings so close by, that de-tune it, but, so far not able to find a length that will work on all three bands.

The closer to 1/2 wavelength the antenna is, the less demand for a counterpoise thus the less radiation by the short CP. With a 50' end fed wire on 30m just a few feet of wire will do the CP job however the impedance of the antenna is very high and can be difficult to match (Hi-Z)
.
With the 50' wire on 30m, your maximum radiation will happen at the 25' point which would typically be up in the air. If the support is 25' tall you end up with a very nice inverted L and a combination of vertical and horizontal polarization plus excellent low angles for DX. Almost anything can be used as a counterpoise.

I'm not sure what the limitations of the BLT tuner are but normally a parallel LC tuner is needed for end fed 1/2 wave antennas.

Obvioiusly there is no single length of wire that works like this on all bands! Some insulators and jumpers can be used to vary the length.

Heres a nice line for end fed ants.

Hi Dwayne,
1 I use 15 inches, and if I have a need to wrap around my finger to "feel" it better, I start with 17 inches, and have a good bit to trim off.
2 The Secondary, is wound between the two end turns of the primary... or as an extension of windings after the primary is wound, with a 1 in loop between the two.
So it is a long primary, then a space on the core, and a continuation of winding of the secondary, then stop.
3. Did I miss anything?
Have a great day building... it is a whole lot better than about any other day I can think of.... 'cept maybe being on the air.

Yes it's hard to beat a 1/2 inverted L once you get it matched up. Having the main radiating portion up at the joint really does wonders.
Sometimes putting a fixed value capacitor in series with the end fed wire will bring it into range for a tuner. Try 50pf for starters. Just clip it in right at the rig. If that doesn't help, try 100pf. etc.
I did this to a 150 ft. end fed and made my MFJ auto tuner very happy!

Hi Lynn,

Is the Lambda antenna your idea, or something you saw?

Did you model it, or was it an empirical development?

It looks a lot like an Off-Center Fed Dipole, fed with a 10-foot
transmission line that has a wide range of possible impedances that
transforms the antenna impedance to something the PFR-3 can match.

Can you tell us more about how the antenna was developed?

tnx es 73,

I don't see why not. My first thought was to use a 50-foot roll of Radio Shack #18 speaker wire. Both are somewhat lossy with no control over impedance, but no worse than individual insulated wires taped together, and perhaps a bit easier to deploy. You'd need a ty-wrap at the end of the "transmission line" to keep it from "unzipping".

Hi Ed,

This is my third purpose built PFR-3A antenna and is basically just an experiment to see if I could add a bit of feedline (10') to the previous antenna I used that was (apparently) very efficient. The old antenna was the 34 end fed wire with 15 ft counterpoise on ground. The "Lambda" antenna is just the same 34+15=49 ft antenna with a 10 foot parallel wire feedling (say 100 to 120 ohm) feedline added that allows the feed point to either stay on the ground or be hoisted up to give the counterpoise a bit of elevation. (It works either way.)

Yes, I think of this like an OCF antenna too. In round numbers, the 49 ft conductor is 0.7wave, 0.5 wave or 0.35 wave depending on band 20/30/40 meters and the feed is set at about 30% of the total conductor length. I do understand, but am still studying, the impedance mismatch and radiation from feedline. Unequal currents are likely flowing in the feedline and it is likely radiating as part of the system. But it seems the BLT works, and antenna is efficient enough to make contacts at 5 W power level. I am still trying different configurations - Thomas Edison style. No computer modeling yet.

Oh, yes the zip cord would work I think. My wire is the stuff they sell in 500 ft spools for underground dog fence. 20 Ga, solid, HDPE insulation, UV resistant. I also used this wire for 300 ft loop. It is cheap, light and durable. (You might note a little flat black paint on part of the wire, left over from earlier stealth antenna experiment.)

Bill,

The keyer memory problem was fixed some time ago, so if you just recently bought the kit, the firmware is not the problem.

The original problem was with the display update interupt which could randomly corrupt the reading of the EEPROM data when sending the message from memory. Depending on the length of the message and the code speed, the memory would only glitch on occasion. Which was why the problem was not noticed for a while. The problem ONLY occured after the message was stored and then sent from eeprom memory.

If the characters are not being sent properly in the review part of the procedure, I am sorry to say the problem is with your sending. The processor relies on close to ideal spacing between elements to determine when a character has been completed or when a word space is to be inserted. Many people run thier code elements together with insufficent pause between letter element groups and this is what causes the gibberish to be stored.

You are 100% correct, Steve, I had to try about 4-5 times, but, finally sent it the way the keyer likes, and now it sends a good 3X2 CQ.

My PFR3A is now complete and working FB. What a nice little rig. One of these days I'm going to have to put it aside, and start using my K3 again.:)

Hello
I find this really good antenna solution
I think the operation will always be better than a coaxial cable, since the pfr3 a release planned for this it must be used because

Thanks for a very well done and informative video, Lynn. I don't have a nice big back yard like yours, nor do I have any tall trees like you do, but, just might build this antenna and keep it in my box of stuff for the PFR3.

I did an EZNEC model of this antenna. With the cp horizontal at 8', the patterns were similar on all 3 bands being mostly omni directional but with a higher angle lobe favoring the "counterpoise".
Certainly the short side of the antenna radiates just as well as the long side since it's acting as the return circuit for RF. Most of the losses will occur from the cp especially if it's laying on the ground!

Here's an idea: Add at least one more cp in the opposite direction. Voila...you now have a vertical with 2 radials. Assuming that they cancel each other to some extent, your efficiency should improve and radiation angle should be lower.
4 radials would be slightly better but getting a bit complicated to support. Of course I'm referring to elevated radials.
Sounds like a fun project using a field strength meter across the yard and the other radial with an alligator clip on the end.

I found my PFR3a can drive my 100w Palomar amp to about 80 watts today. Needless to say, signal reports improved greatly! I used a tuner on the amps output to help keep things clean.

Steve,

Thanks for the antenna modeling info!

Here are notes I took in the backyard on Friday: I tested the antenna with three different feed point elevations, each also with a different configuration of the Counterpoise (CP), i.e. the short 15 ft bottom element : (1) First with feed point at ground level and CP resting on ground in a straight line (part of feed line on ground too), then (2) feed point elevated 8 feet (2.4m) above ground with CP vertical and L-shaped with last 7 ft (2.1m) of CP resting on ground, and (3) finally with feed point 10 feet (3m) above ground with CP sloping at an angle ending at 3 feet (1 m) above ground. In this configuration, I sat under the shade tree for about an hour chatting with George K9WWT on 40 m short skip. (4) I also tested the antenna in a fourth configuration, in with the CP elevated 6.7 ft (2m) and parallel to the ground surface - however I did not include those results because I used a metal pole to support the bottom element which likely affected the tuning since I could not find a match on 14MHz. I will have to repeat that part of the experiment with plastic or wood supports.

I included rough settings of the "Tune" and "Load" knobs, but realize the setting tolerance is so narrow this might be useful only as a general guide. I also added notes in table corresponding to configuration of antenna (height of feed point and position of the short element) that was used in the 20, 30 and 40m recordings shown on the YouTube video.

TUNING NOTES FOR HENDRICKS PFR-3A and “λ-ANTENNA”: This antenna is the 34’ end fed and 15’ counterpoise with the addition of a 10’ parallel wire feed line.

NOTE, LOCAL SURROUNDINGS SIGNIFICANTLY AFFECT TUNING; THEREFORE BLT SETTINGS ARE ONLY APPROXIMATE. AND POSITION OF DIAL INDICATORS VARIES PER UNIT. FIELD ERECTED ANTENNAS WILL ALL DIFFER; THIS IS JUST A RECORD OF ONE SPECIFIC INSTALLATION. TEST DONE WITH LEAVES ON TREE AND GROUND IN FAIRLY DRY CONDITION. HIGHLY CONDUCTIVE NORTHERN ILLINOIS SOIL. RESULTS WILL VARY.

CONNECT TOP WIRE TO RED TERMINAL, BOTTOM WIRE TO BLACK TERMINAL. ANTENNA SWITCH TO BALANCED LINE. SELECT BLT. WITH CARE, IT WAS POSSIBLE TO OBTAIN SWR MATCH AND COMPLETELY DARKENED LED ON ALL BANDS WITH ALL THREE FEED POINT CONFIGURATIONS. TUNING TAKES SOME REAL PRECISION, UNLESS NOTED THAT TUNING IS “EASY”.

3136. Question for Lynn, NG9D

Yahoo group: pfr3_group
Date: 2011-09-06 21:56:41 UTC
From: k6mgo@verizon.net
Topic: 3136 Message: 3136

Hi Lynn, from watching your video's, it appears you are using the PFR3 with internal batteries. Was wondering what batteries you use, and how much power out you get.

Reason I ask is, I know if I get NiMH cells, they only have 1.2V per cell, which is 9.6V for the eight of them. If I use AA dry cells, I can get 1.5V per cell or 12V for the eight. Which is what I'm doing now. However that is a tad expensive, and not very "green".

I can operate my PFR3, from a 12V, 5 Ah SLA battery I have,but I really like the idea of using it self-contained.

With the 12V SLA, I get 5.0 watts out on 40m, 4.9 watts out on 30m and about 4.7 watts out on 20m. And with the AA dry cells, I get almost the same power out, within a few tenths from fresh cells.

Just curious, as to what you are doing?

Tnx. & 73

Hi Bill,

Yes, I agree the rechargeable internal batteries are the way to go. Light and less items to carry. I use Energizer 2300 mA-hr Nickel Metal Hydride AA batteries for the PFR 3A. The 8-AA internal batteries seem to out-last me. I keep a spare set of 8-AA charged up and change them periodically. I have been changing them about every other week lately, so if they are good for several hundred charge cycles they are going to last a long time, and much better than alkalines wrt cost and our ecology I think.

I have a couple of 4xAA Energizer re-chargers with battery compartment that slides in and AC plug that folds on a hinge so they become 3x3.5x1.25" that are compact for travelling. These particular chargers charge very fast compared to my old charger. I don't know if the rapid charging is more harmful to the batteries, but it sure is convenient. I can recharge same day, with old charger I had to charge overnight.

For power output, I only checked that on a T1202 which is also a kit. In retrospect, I recall that when I built the T1202 I calibrated it based on the power output meter on the IC 703. I don't claim it is very precise, and so the 5W I measured on the PFR 3A with the internal batteries might have been off somewhat. Anyway, the power output was about the same on all three bands and I am having an absolute blast with it!

73,
Lynn

Subject: Re: [pfr3_group] "Lambda" Antenna for PFR-3

Hi Ed,

This is my third purpose built PFR-3A antenna and is basically just an experiment to see if I could add a bit of feedline (10') to the previous antenna I used that was (apparently) very efficient. The old antenna was the 34 end fed wire with 15 ft counterpoise on ground. The "Lambda" antenna is just the same 34+15=49 ft antenna with a 10 foot parallel wire feedling (say 100 to 120 ohm) feedline added that allows the feed point to either stay on the ground or be hoisted up to give the counterpoise a bit of elevation. (It works either way.)

Yes, I think of this like an OCF antenna too. In round numbers, the 49 ft conductor is 0.7wave, 0.5 wave or 0.35 wave depending on band 20/30/40 meters and the feed is set at about 30% of the total conductor length. I do understand, but am still studying, the impedance mismatch and radiation from feedline. Unequal currents are likely flowing in the feedline and it is likely radiating as part of the system. But it seems the BLT works, and antenna is efficient enough to make contacts at 5 W power level. I am still trying different configurations - Thomas Edison style. No computer modeling yet.

Oh, yes the zip cord would work I think. My wire is the stuff they sell in 500 ft spools for underground dog fence. 20 Ga, solid, HDPE insulation, UV resistant. I also used this wire for 300 ft loop. It is cheap, light and durable. (You might note a little flat black paint on part of the wire, left over from earlier stealth antenna experiment.)

Hi JP,

Feeding at 33% or 30% from the bottom probably doesn't matter, since the BLT has wide range and difference is small. So say ~15m overall length antenna, fed off-center about 4.5 to 5m from bottom end. Maybe 3m transmission line could be extended a bit, depends how hight the antenna can be positioned. Thanks for the idea, I will try it!

I used semi-twisted pair line to also feed the 50 ft (~15m) doublet / inverted V and it worked fine with the PFR-3A too. That antenna also tuned on all three bands. I have not tried zip cord. All three PFR -3 antennas I have tried so far use an antenna element overall length of roughly 50 feet (~15m) total. Each of the antennas can be tuned to flat SWR (dark LED indicator) on the PFR-3A on all three bands, 40, 30 and 20 meters. The parameters I have varied with these antennas and progression of testing so far is:

It's a good job Lynn
I think seriously about changing my antenna Levy which is fed to the center, because I think that this mode can give better results
in multi - band and that the impedance can be better than the center line for the descent parallel.
The impedance is quite high on some bands with a power center.
I know that the currents will not be out of phase, but you just have to do the right thing at the bottom with processors with coils or torroids
or binoculars, maybe there will be nothing to change and it works better ...

Hi Stan,

That all depends upon your definition of "effective". If you mean wide range, can transform practically any load to 50 Ohms resistive over a wide range of frequencies, then no, it's not effective. However, it wasn't designed to do that.

The tuner in the PFR-3 is based upon the NorCal "BLT" tuner designed by Charlie "The Tuner" Lofgren, W6JJZ which is a modification of his Z-Match design. The typical range the BLT can transform to 50 Ohms is from about 25 to 500 Ohms, more or less depending upon what reactance appears at the radio end of the antenna feedline. It had to fit inside the PFR-3 and transform a reasonable range of impedance over 3 bands using either balanced feeders, end-fed wires or coaxial cable fed antennas. And for that it does a more than satisfactory job.

Will it work with the antenna you describe? That all depends upon what the impedance is at your antenna's feedpoint and the length of your feeder at a particular frequency of interest.

The resulting performance is more dependent upon things like antenna height above ground, configuration (Vertical, horizontal doublet, L, V, sloper, etc.), surrounding objects, feedline loss and so on. There are things that you can do to any antenna to 'make it play' with the PFR3A.

I would suggest simply setting up your antenna in a field-like environment and see how it performs. Be forwarned that the tuner in the PFR3 is touchy to adjust. This is typical of Z-match tuners in general, not a fault of the PFR3.

Best of luck with your little yellow box.

3151. Re: [pfr3_group] "Lambda" Antenna for PFR-3

Yahoo group: pfr3_group
Date: 2011-09-14 11:16:20 UTC
From: lahagar1@aol.com
Topic: 3074 Message: 3151

Ed,

Thank you. I like your description of the Lambda Antenna: "Off-Center Fed Dipole, or an Off-Center Fed Sloper, or a Vertical with one (or two) counterpoises - the radiation pattern is essentially that of a vertical."

I was thinking about the tuning of this antenna with the PFR-3A BLT. It works great on 40m, but I admit feeling a bit like a "safe-cracker" on 30m and 20m. Once tuned however, the BLT worked fine.

However, I was curious why this antenna tuned the way it did with the BLT, so decided to try the "Lambda" antenna with external L-Network tuners and various transceivers.

Conclusion: The L-tuner works well matching the "Lambda" antenna to HF rigs. Summarized in 7 minute video, here are the results for a home-brew L-tuner used with PFR-3A and Ten Tec T1300s, and an MFJ 16010 tuner used with ICOM 703:

This has been a great discussion of the PFR-3 Lambda antenna. Lynn has devoted a lot of time to its development, and Steve's EZNEC analysis provides us with a good description of the operation of the antenna.

Note that - whether you call it an Off-Center Fed Dipole, or an Off-Center Fed Sloper, or a Vertical with one (or two) counterpoises - the radiation pattern is essentially that of a vertical... more or less omni-directional. Lynn's Tuning Chart is a good reference for the impedance matching settings. It's definitely an easy antenna to take along, and easy to deploy.

Thanks for posting this Lynn. This is what makes these reflectors so valuable.

3152. experiment with different power supplies.

Yahoo group: pfr3_group
Date: 2011-09-14 21:35:22 UTC
From: k6mgo@verizon.net
Topic: 3152 Message: 3152

I have been very curious as to the effect of different power sources had on power output from my PFR3, so I ran some tests and here are the results I got.

Power output, with unit on 12V, 5 AH SLA battery. PO measured by measuring rectified voltage across 50 ohm dummy load and calculating power output by standard formula's.

40m= 4.6 watts
30m= 4.8 watts
20m= 4.6 watts

Power output, with unit using 8, Duracell copper top dry cells, @1.5V ea. Note, batteries were used over an hour, not new. so read 11.67V with Receiver on.

40m= 3.8 watts
30m= 4.0 watts
20m= 3.8 watts

Now I didn't have any rechargeable cells available, so I adjusted my MFJ power supply to 9.6 volts out, and took measurements with that.

40m= 2.8 watts
30m= 2.1 watts
20m= 2.8 watts

So, you can see that even fully charged NiMH batteries would not equal what I'm getting from AA dry cells that have been used for a while.

Next, I was wondering what the drop across the battery holder is under full load. I'm sure this can vary a lot, and more so when the holder gets older. Mine is new.

My measurement might not be strictly Kosher here, because rather than measure each cell and add them to get the voltage of all 8 cells, I measured one cell and multiplied by "8" to get the before holder voltage. But, I'm figuring"it's close enough for government work".

PFR3 running on internal AA dry cells, into a dummy load, voltage at unit is 10.78V and calculated as above, across batteries, 11.04, when transmitting into dummy load, so looks like the holder is only dropping 260mv which is not bad, and still giving better voltage to the unit than rechargeable cells would.

Hope this helps or is of interest to a few of you.

73, Bill, k6mgo

Topic: 3152 Message: 3153

Hi Bill, I have also tried two different power supplies and received 'interesting' results. When using a regulated 13.8V PS with five diodes in the positive lead to drop the voltage to about 12.2V, I get just about 5W out on all bands, as read by the power meter on my MFJ-941E. I then bought a variable DC power supply, an ATTEN APS1502D (0-15V, 2A) I now get about 9W out on all bands as read by the same power meter. I have checked the output voltage with a DVM which reads 11.96V (as opposed to the 12V on the PS digital readout). Anyway, I have a great qso with the rig in this power configuration with a Russian station. Coming from VKland, I was thrilled. He gave me a 559 too.

Nice video, Lynn. It looks like the L-Network is much easier to tune than
the one in the PFR-3, is that the case?
If so, the "safe-cracker" tuning method must be the result of making the
impedance matching network a dual-purpose (balanced / unbalanced) network
that will handle both high and low impedance loads.

Your L-C matching network might turn into a useful mod for the PFR-3. While
the PFR-3 *will* match a variety of balanced and unbalanced loads, there
have always been remarks about how touchy the tuning is. You may have found
the solution for unbalanced loads.

3155. Case thumb screws...a question...

Yahoo group: pfr3_group
Date: 2011-09-18 04:20:16 UTC
From: John Farmer
Topic: 3155 Message: 3155

Hi All,

I've been lurking here for quite while reading all your informative posts and today, I've just started building my PFR3. Smoke test at the end of build part 1 has gone OK, so it's on with the rest.

The kit was missing the decal sheet and both the red and black binding posts had damaged threads. But other that those minor issues, the kit was complete. Doug is sending out replacements.

I have a question about the black thumbscrews that hold the case together. I'm going to try to source some extras and don't know their details. I'm guessing they're an imperial size, but I'm not sure. Anyone know the size of these?

Looking forward to moving on with part 2.

73,
John

Hi Grant,

Well, in fact - I think you might be right! :) I was after a few spares to add to the kit for the day when I lose one or two. It's certain that will happen, so I wanted to be prepared. Anyway, it's all sorted out.

The PFR3 build is progressing well so far. I'm having a lot of fun. I love building kits. I built a Weber Dualbander a couple of years ago and that was a great little rig too. I love the audio on Steve's rigs. My CW skills are not flash, but I'm improving and this will make sure I unplug the mic for a while and get working some CW QRP to make the most of these sunspots we're having!

3158. C17 position in Group 2 mods- instructions and schematic differ...

Yahoo group: pfr3_group
Date: 2011-09-19 12:11:16 UTC
From: John Farmer
Topic: 3158 Message: 3158

Hi All,

I'm doing the Group 2 mods, p 9 of the manual, which eliminate the display noise from the receiver audio.

In step 2 of these mods, the instructions and the photo on that page describe installation of a 470pf disc cap between pins 3 & 4 of U3 on the bottom of the board. This is designated C17.

Problem is, when I look at the schematic, C17 is shown between pin 5 of U3 and ground, which is pin 4.

So the instructions and the schematic describe different placement of this cap.

So...which is correct, I'm wondering? What did Steve intend?

Thanks for any advice,

John
VK7JB

Answering my own question here - sorry!

I had a careful look at the board. I think the intention of C17 is to bypass R7, just as R6 is bypassed. So, that would mean that the pin numbers on the schematic are incorrect, but the instructions on page 9 are indeed correct.

I think that's right? I hope I'll hear if I'm not. :)

With the solar numbers so high, and the soft breezes through the flores cent colors, the committee has negotiated with the Game Warden, making a wonderful deal for each of us, Hounds and Foxii, Fox Hunt entrodinaires that we are!! With no snow to hinder and not a hint of cold.... Well not much, the faint sound of falling leaves is about to be drowned by the pounding of many furry feet in hot pursuit of this summer's seasoned foxii fleetingly bounding down the trails of the 20 acre wood.

Now the straight (really) info:
Next Thursday, with the edges blurred a bit to allow a little more wiggle room, promptly starting at 0100z or 7pm MT whichever occurs first, all of this summer's season of Foxii will be found by the diligent and deserving Hounds, when that occurs and a pelt is awarded in the form of a proper exchange of rst, state, name, and output pwr. There were 20 seasoned Foxii and a few that have been resting up (the "spare" Foxii) so there will be plenty of Foxii to grab pelts from. After the phat gal screeches, we will find interesting and funny stories floating along in the digistream aka the qfoz reflector.
Questions?? Ask, please, it is easier that way.
And the Score keeper says the foxii may post their logs, but he won't be scoring them.

Happy Hunting, and Good Luck to all and to all many many pelts,

http://www.qrpfoxhunt.org
Have a great day,
Dale - WC7S

3165. Balanced Line Tuner

Are the Tune mode and the BLT only for use with balanced feed line antennas or they also used with coax fed antennas? I found the document confusing regarding their use.

In any case, the little yellow box seems to be doing a fine job feeding my center-fed zepp.

3166. Audio amp white noise hiss

From: John Farmer
Topic: 3166 Message: 3166

Hello Group,

I'm progressing with my PFR3 and would like to share a tip in case it's helpful to anyone.

I have sensitive, well preserved high frequency hearing and one of the difficulties this causes is that I can easily hear high frequency white noise hiss, a common features of many audio amps, including the LM386. I don't like it because it's fatiguing, detracts from aesthetically pleasing audio and degrades S/N for weak signal listening. Some amps are better than others, but when I was testing the PFR3 receiver, I was surprised that the white noise in my unit was quite obtrusive. In fact, very obtrusive. Using my several sets of earphones, it was present with them all and clearly heard with the AF gain closed right back and antenna disconnected. Just the usual white noise hiss.

My usual "fix" for this is to use either a low pass audio filter on the headphone line, or to add some resistance in series with the headphones. I tried a "headphone attenuator" in line with the phones connected to the PFR3, added some resistance that way and, happily, the hiss disappeared.

But I was puzzled, because I also have a DualBander designed by Steve and that little rig is distinguished by superb audio through phones and not one bit of white noise hiss. The reason I was attracted to the PFR3 was because of the audio of the WDB and my recollection was that the design of the audio stages around the LM386 in both rigs was identical. So I got out the schematics again and compared them and I found that there is a difference - the Dualbander has a 270ohm resistor wired in series with the headphone AF line. The PRF3 doesn't.

So, with a little minor surgery to the PFR3 board and a single resistor, the PFR3 hiss is eliminated and the audio is every bit as easy to listen to as the DualBander.

I experimented with different values of resistor, listening for the effect on the amp white noise and noting the trade off against reduced AF gain resolving a 1uV signal from my signal generator. Somewhere between 180 and 270 ohms seemed optimal, so I used a 220ohm resistor. The signal gain is still sufficient: I can easily hear the 1uV (-107dbm) signal in a normal room with the AF gain control open 2/3.

Perhaps this will help someone else with sensitive high frequency hearing enjoy their PFR3 even more.

73,

John

3167. Alignment steps = a question...

Yahoo group: pfr3_group

Hello again - hoping someone might help with a question about the calibration procedure:

If I don't have an oscilloscope, is there a method of doing the IF offset adjustment another way, or do I just accept the defaults?

I've calibrated the ref frequency (step 1) against my K3, which I know is well calibrated to WWV within a couple of hz, and I have no trouble doing the BFO adjustment(step 3) by ear, it's just the second step I'm wondering about.

Thanks in advance for any tips.

John

Hi John, You could use your ac meter, to measure the audio out, and peak it, or use your ear and count the steps. I admit, I haven't tried either, yet.Simply hadn't thought about it. Have a great day,
